QAPP	Quality Assurance Project Plan
RA	remedial action
RDX	Royal Demolition Explosive
RG	Remedial Goal
RI	Remedial Investigation
ROD	Record of Decision
SOU	Soil Operable Unit
SpC	specific conductivity

SQL	Sample Quantitation Limit
SVOC	semi-volatile organic compound
TAL	target analyte list
TNB	1,3,5-trinitrobenzene
TNT	2,4,6-trinitrotoluene
TolTest	TolTest, Inc.
µg/L	micrograms per liter
USACE	United States Army Corps of Engineers
USAEC	United States Army Environmental Command
USDA	United States Department of Agriculture
USEPA	United States Environmental Protection Agency
VOC	volatile organic compound

1.0 INTRODUCTION

This report has been prepared by TolTest, Inc. (TolTest) in conjunction with teaming partner MWH Americas, Inc. (MWH), for environmental remediation services at the former Joliet Army Ammunition Plant (JOAAP) on behalf of the United States Army Environmental Command (USAEC) Assistant Chief of Staff for Installation Management (ACSIM) under Indefinite Delivery/Indefinite Quantity (ID/IQ) Contract No. W91ZLK-05-D0012, Delivery Order 0001.

This report presents the Spring 2012 (February/March [February] and April) groundwater quality data for the long-term monitoring (LTM) program of the Groundwater Operable Unit (GOU) and landfill inspection documentation for March and April inspections for the Soil Operable Unit (SOU) at JOAAP in response to the *Record of Decision for the Soil and Groundwater Operable Units on the Manufacturing and Load-Assemble-Package Areas* (U.S. Army, 1998), (ROD) for the JOAAP facility. The remedy that was selected for the GOU Sites at JOAAP was monitored natural attenuation (MNA). As a function of the MNA remedy for the Groundwater Remedial Units (GRUs), LTM is required. This requirement is intended to satisfy three primary objectives:

1. Monitor contaminant concentration reductions and plume migration;

2. Verify containment of contaminant concentrations greater than Remedial Goals (RGs) within the Groundwater Management Zones (GMZs); and

3. Evaluate the effectiveness of SOU remedial actions (RAs) and MNA for the GOU remedy.

These objectives are being met through implementation of the LTM program.

In addition to the GOU, the SOU remedial actions included the construction of three landfills at Sites L3, M11, and M13. Landfill inspections are required quarterly to determine if the remedy continues to function as designed. Post-closure inspection reports for March and April for landfills L3, M11, and M13 are included in Appendix A.

The objective of this report is to provide a data submittal of the groundwater quality sampling results, provide a review of the data collected during spring 2012, and provide documentation of landfill inspections. Additionally, water table and potentiometric surface maps for the March quarterly (Landfill M13) and April semi-annual sampling event are included.

1.1 FACILITY DESCRIPTION AND BACKGROUND

Joliet Army Ammunition Plant was a former United States Army (Army) munitions production facility located on approximately 36 square miles (23,542 acres) of land in Will

County, Illinois (Figure 1-1). The former facility is located approximately 60 miles southwest of Chicago and 14 miles south of Joliet, Illinois. As shown on the Groundwater Studies Area Map and Landfill Sites (Figure 1-2), the JOAAP property is divided into two main functional areas: the Manufacturing (MFG) Area, west of Route 53, and the Load-Assemble-Package (LAP) Area, east of Route 53. The facility has been described in detail in Section 1.1 of the *Final Long-term Monitoring Plan for Environmental Remediation Services* (LTM Plan [TolTest/MWH, 2010]).

The MFG Area, covering approximately 14 square miles (9,159 acres), is where the chemical constituents of munitions, propellants, and explosives were produced. The production facilities were generally located in the northern half of the MFG Area. In the southern half of the MFG Area, there was an extensive explosives storage facility. The LAP Area, covering approximately 22 square miles (14,383 acres), is where munitions were loaded, assembled, and packaged for shipping. The LAP Area contained munitions filling and assembly lines, storage areas, and a demilitarization area.

Joliet Army Ammunition Plant was constructed during World War II. The production output varied with the demand for munitions. Although the plant was used extensively during World War II, all production of explosives halted in 1945. At that time, sulfuric acid and ammonium nitrate plants were leased out, and the remaining production facilities were put in layaway status. The installation was reactivated during the Korean War, and again during the Vietnam War. Production gradually decreased until it was stopped completely in 1977.

Hazardous wastes were generated and released into the environment through several pathways. Process waters used in the production and handling of 2,4,6-trinitrotoluene (TNT) and other compounds were discharged into drainage systems. Buildings and equipment were periodically washed to remove explosive residues and the wastewater would be allowed to leach into the ground or flow into the local surface water and creeks. Later, process water incineration or industrial wastewater treatment produced ash or explosives residue that accumulated over time. Ash from the incineration of production by-products was stored in landfills on-site. Equipment and demolition materials were flashed (burned) to remove residues. Fire training areas, used to keep fire and safety personnel suitably prepared, introduced contaminants to the soil and groundwater. Leaks and spills occasionally occurred in the storage and handling of oils and other liquids. Wastes and unusable explosives and munitions were burned or detonated. In addition, munitions were tested, leaving some residuals in the soil at the test sites. Vehicle and equipment maintenance, transformer leaks, and the handling of pesticides introduced further contamination to the soil.

Wastes generated during production activities resulted in environmental contamination at various sites around JOAAP. Because of this contamination, the United States Environmental Protection Agency (USEPA) placed the MFG Area on the National Priority List (NPL) on July 21, 1987 and the LAP Area on the NPL on March 31, 1989.

The contaminated media identified at JOAAP were divided into two operable units (OUs) to aid in the development and evaluation of remedies. The SOU consists of sites where contaminated soils, sediments, and debris were identified. The GOU consists of sites where contaminated groundwater was identified. Surface water was determined to pose no risk to health and the environment and therefore is not addressed further as a contaminated media. However, surface water discharge is a major component of the shallow groundwater system, and localized detections of explosives may occur near contaminated groundwater sites. For this reason, surface water is relevant to the GOU.

Substantial land at JOAAP is not contaminated. Transfer activities for that land have occurred and some are still underway. After remaining potential hazards to human health and the environment are addressed under the SOU and these properties are found suitable for transfer under Public Law 104-106 and the Comprehensive Environmental Response Compensation and Liability Act (CERCLA), the Army will prepare documentation for transfer.

The Illinois Land Conservation Act of 1995, PL 104-106, Div. B, Title 2901-2932, February 10, 1996, states that the Army will transfer JOAAP land to various federal, local, and state jurisdictions. Transfer of land is occurring incrementally as it is remediated and is deemed appropriate. As of production of this report, the distribution of JOAAP land through these incremental transfers is approximately 17,726 acres to the United States Department of Agriculture (USDA) for establishing the Midewin National Tallgrass Prairie; 982 acres to the Department of Veterans Affairs to establish a Veterans Cemetery; 455 acres to Will County, Illinois to establish the Will County Landfill; and 2,885 acres to the State of Illinois to establish two industrial parks.

Where groundwater contamination is present within areas to be transferred, the Army has included institutional controls (ICs) in the transfer documents to prevent exposure to contaminants, limit groundwater pumping, and prevent manipulation of the natural groundwater flow patterns through any means. These controls will help to limit the spread of the remaining contamination in groundwater and will remain in effect with the land until removed by mutual agreement of the Army, USEPA, Illinois Environmental Protection Agency (IEPA), and the current landowner.

1.2 NATURAL ATTENUATION MECHANISMS

The selected remedial action for the GOU is remediation by natural attenuation. A detailed overview of the physical, chemical, and biological criteria, which are most directly linked to natural attenuation mechanisms and the site-specific criteria used to evaluate natural attenuation at JOAAP is provided in the LTM Plan and annual groundwater monitoring reports where natural attenuation is evaluated and reported.

1.3 RECORD OF DECISION REQUIREMENTS

The ROD specified general groundwater monitoring requirements. These requirements were based on information presented in the Remedial Investigation (RI) Report and did not have the additional information provided by the predesign investigation completed in 1998 or subsequent remedial actions completed at JOAAP. As such, the Army applied subsequent site data as well as historic data to arrive at site-specific LTM locations and analytes, which were included in the LTM Plan.

Based on the objectives presented in Section 1.2 of the LTM Plan and as an extension of the ROD, several types of monitoring are required for each site. These include:

- Collection of groundwater samples to evaluate contaminant concentrations;
- Collection of surface water samples where groundwater discharges to surface features to evaluate surface water contaminant concentrations;
- Collection of depth to water measurements to evaluate groundwater flow;
- Documentation and evaluation of source removal or surface disturbing activities;
- Documentation of changes in surface water features, impoundments, or conveyances; and
- Evaluation of evidence concerning illicit water withdrawal affecting contaminant migration.

1.4 LONG-TERM MONITORING PLAN

Monitoring activities are required pursuant to the decision documents developed for the various contaminated sites found at JOAAP. The LTM Plan was produced to present LTM activities for the GOU and required SOU maintenance activities. The LTM Plan includes activities associated with long-term maintenance of the remedies selected for JOAAP. The objective of the LTM Plan was to provide a sufficiently detailed description of the monitoring strategy and process and to establish realistic expectations for execution of the program on the part of all stakeholders. With respect to the latter objective, it is the intent of the plan to establish both the actions to be taken in the event of various sampling outcomes and the set of conditions required to reduce and eventually discontinue long-term monitoring efforts where practicable. As such, it includes sample collection and analysis of ground and surface water, surveillance of cap maintenance and access restrictions at landfills, and surveillance of land use restrictions and other ICs implemented on an installation-wide basis.

Section 3.1 of the LTM Plan summarizes the GMZs and monitoring well designations and discusses the decision tree for interpretation of groundwater quality results and the logic for

optimizing site monitoring programs. Section 3.2 of the LTM Plan discusses IC monitoring required as part of the MNA remedy.

The LTM program is presented in Section 4.0 of the LTM Plan which includes a discussion of site-specific monitoring programs for the GMZs and landfills, monitoring well installations, abandonments, monitoring schedules, requirements for IC monitoring, and reporting schedules. Tables A1-1 through A1-9 of Appendix A (Field Sampling Plan, [FSP]) of the LTM Plan provide specific information about the monitoring requirements at each site. However, it is expressly presented that the LTM program will likely change with changing conditions. Therefore, the LTM Plan tables were consolidated into a single table that is continually updated based on groundwater monitoring results and periodic reviews. The sampling completed for spring 2012 is presented as Table 1-1 in this report and summarizes the monitoring locations and requisite analyses for those sample locations.

The LTM Plan provides a site-specific evaluation of the natural attenuation remedial option that is being applied to all GOU sites. The purpose of the LTM Plan is to:

- describe the process by which data will be collected and analyzed,
- determine if remedies in place at JOAAP are protective of human health and the environment,
- describe the nature of monitoring results that, if observed, would indicate further action be taken because the remedy does not appear to be sufficiently protective,
- prescribe the conditions under which certain monitoring activities may be terminated, and
- provide a detailed description of activities to monitor the GOU natural attenuation RA.

Section 5 of the LTM Plan describes reporting requirements for LTM activities. The LTM Plan reporting schedule requires the submittal of a semi-annual report, which is a presentation of the results of the winter and spring sampling events with minimal analysis, and an annual report that presents the results of the summer and fall sampling event with detailed evaluation of trends in the groundwater data. The semi-annual sampling schedule identified in the LTM Plan indicates that the sampling periods will generally be January and October of each year at all sites except Landfill M13, which is sampled quarterly, generally in January, April, July, and October of each year. In 2012, the winter quarterly sampling event at Landfill M13 was conducted during February and the spring semi-annual sampling event was conducted in April. Annual groundwater monitoring reports are the venue in which data are analyzed and proposed changes to the LTM Plan are presented. Acceptance of the final annual groundwater monitoring report by regulators will constitute approval of recommended changes in the monitoring program.

The LTM Plan also provides for a five-year review of the GOU natural attenuation remedy and SOU remedy, as required by the ROD. Natural attenuation data were collected during the Fall 2003 sampling event to facilitate the first five-year review. The First Five-Year Review Report was completed following the Fall 2003 sampling event. The Final Second Five-Year Review Reports for the GOU and SOU were submitted in August 2009. Subsequent five-year reviews will be completed to evaluate the effectiveness of the GOU and SOU remedies and, if necessary, provide recommendations to modify the remedy to make it more effective. The Third Five-Year Review Report will have the GOU and SOU remedy protectiveness evaluated in one consolidated document. Furthermore, if the third five-year review suggests that natural attenuation may not result in reasonable agreement with ROD requirements, evaluation of available contingency remedies will be presented as part of the five-year review process.

2.0 SITE ACTIVITIES

This section provides a summary of the LTM Plan requirements, the groundwater monitoring activities at each of the GOUs, and the SOU RA landfill inspections.

2.1 GROUNDWATER MONITORING

This section provides a summary of the field activities undertaken to perform winter and spring quarterly groundwater monitoring at Landfill M13, and spring semi-annual monitoring at remaining GOU and SOU sites. Site L2 was not sampled in Spring 2012 as recommended in the 2009 Annual Report. Site L14 was not sampled in Spring 2012 as recommended in the 2010 Semi-annual Report.

The measurement of water levels at the monitoring wells was conducted using an electronic water level indicator. Depth to water was measured from a datum mark on the top of the well casing at each monitoring well. All measurements were to an accuracy of +/- 0.01 foot (ft).

In accordance with the standard operating procedure for low-flow sampling, monitoring wells were purged and sampled using low flow sampling techniques at a flow rate of approximately 100 to 250 milliliters per minute (ml/min). Dedicated ¼-inch (in.) outside diameter (OD) Teflon™ lined polyethylene tubing is installed in each monitoring well. The Teflon™ lined polyethylene tubing is connected with dedicated silicon tubing to a variable speed peristaltic pump. During purging, the pump discharge tube is attached to a multi-probe water quality meter equipped with a flow-through cell. The water quality meter is equipped with probes for measuring field parameters including temperature, pH, specific conductivity (SpC), oxidation/reduction potential (ORP), and dissolved oxygen (DO). The water quality meters were calibrated daily in accordance with Appendix A (FSP) of the LTM Plan and the manufacturer's instructions.

Measurements of field parameters were taken at 2-minute intervals and recorded on Groundwater/Surface Water Sampling Forms. Final field purge parameters are summarized in Table 2-1. Purging of each monitoring well was considered complete when field parameters stabilized over three successive measurements to within 10%. Upon stabilization of the field parameters, the required samples were collected from the discharge tube of the pump into laboratory-supplied containers after disconnecting the flow-thru cell.

Samples were collected in laboratory supplied preserved containers for explosive compounds in one-liter amber glass bottles; target analyte list (TAL) metals in one-liter, nitric acid preserved polyethylene bottles; inorganic parameters nitrate and sulfate in 250 milliliter unpreserved polyethylene bottles; volatile organic compounds (VOCs) in 40 milliliter, hydrochloric acid preserved glass vials; and semi-volatile organic compounds (SVOCs) in one-liter amber glass bottles. Samples were analyzed by Test America,

University Park, Illinois in accordance with Appendix B – Quality Assurance Project Plan (QAPP) of the LTM Plan. Samples collected for inorganic parameters TAL metals, nitrate, and sulfate were field filtered using high capacity 0.45 micron cartridge filters.

2.1.1 February 2012 Monitoring

TolTest/MWH measured water levels at eleven monitoring wells and sampled eight monitoring wells as summarized in Table 1-1. The first quarterly monitoring event in 2012 at Landfill M13 was conducted on 29 February and 01 March 2012.

The gauging of the monitoring well water levels was accomplished using techniques discussed in Section 2.1. Groundwater elevations are summarized in Table 2-2 for the MFG.

Groundwater monitoring was conducted in accordance with Appendix A (FSP) of the LTM Plan, as described above.

Blind duplicate samples were collected at a rate of 10% (1 per 10) for each analyte sample total. Blind duplicate M13-MW999 was collected at parent location M13-MW809 at Landfill M13 for VOCs, SVOCs, explosives, TAL metals, nitrate, and sulfate.

Matrix spike/matrix spike duplicate (MS/MSD) samples are collected at a rate of 5% (1 per 20) for each analyte sample total.

Third-party Level III data validation was completed for all groundwater and surface water samples collected. Based on the results of the validation, a data usability report was completed and is included in Appendix B1 and data validation reports are included in Appendix B2 of this report.

2.1.2 April 2012 Monitoring

TolTest/MWH measured water levels or surveyed a total of 142 monitoring wells and surface water locations at JOAAP. A total of 34 monitoring wells and 1 surface water location were sampled at the MFG (M1, M6, M7, M9, other areas, Landfill M11, and Landfill M13) and 10 monitoring wells and 5 surface water locations were sampled at the LAP Area (sites L1 and L3/Landfill L3) as summarized in Table 1-1. Field activities were conducted from April 10 through 17, 2012 in accordance with Appendix A (FSP) of the LTM Plan.

The gauging of the monitoring well water levels was accomplished using techniques discussed in Section 2.1. Surface water elevations are determined by referencing to the known elevations of nearby benchmarks using a level and rod and from marks on existing structures (bridges) for some locations; where at others a direct measurement with a water level indicator was completed. All gauging and surveying measurements were taken to an accuracy of +/- 0.01 ft. All surface water locations contained water during gauging and

sampling activities. Water level measurements and surveying activities for each site were generally completed within a 24-hour period.

Monitoring well information for the MFG area monitoring wells and water levels measured in February and April 2012 are summarized in Table 2-2. Monitoring well information for the LAP area monitoring wells and water levels at monitoring wells measured in April 2012 are summarized in Table 2-3. Surface water elevations are summarized in Table 2-4. Groundwater and surface water hydraulics are discussed in Section 3 on a site by site basis.

Groundwater sampling was conducted in accordance with Appendix A (FSP) of the LTM Plan, as described above. Surface water samples were collected by directly immersing the sample container into the surface water body so as to fill the bottle if filtration was not required. If filtration was required, a peristaltic pump with tubing placed directly in the surface water body was used for sample collection.

Blind duplicate samples are collected at a rate of 10% for each analyte sample total. The majority of the duplicate samples were collected from monitoring wells that had previous analyte detections. Duplicate samples were collected from eight monitoring wells in the LAP and MFG areas in April 2012. Details concerning field duplicates for April 2012 are as follows:

Duplicate Sample Number	Monitoring Point Sampled	Site	Sample Date	Analyte
MW994	MW652	M6	4/14/2012	Explosives
MW995	MW123R	M6	4/14/2012	Explosives
MW997	MW642	M1	4/12/2012	Sulfate
MW998	MW641	M1	4/12/2012	Sulfate
MW999	MW630	L3/Landfill L3	4/11/2012	Explosives and TAL Metals
MW999	MW362	M13	4/16/2012	VOCs, SVOCs, Explosives, TAL Metals, Nitrate, and Sulfate

Matrix spike/matrix spike duplicate samples are collected at a rate of 5% for each analyte sample total.

Third-party Level III data validation was completed for all groundwater and surface water samples collected. Based on the results of the validation, a data usability report was completed and is included in Appendix B1. Data validation reports are included in Appendix B2 of this report.

Repair activities completed during the April 2012 sampling activities included the following:

- A new lock was added to L1 monitoring well MW173
- A new lock was added to L3 monitoring well MW3
- A weep hole was drilled in the protective casing for M1 monitoring well MW104
- A new well cap was added to MFG monitoring well MW118

Additional required repair activities identified include the following:

- The hinge requires repair on L3 well MW411
- A new lock and weep hole are required at M9 monitoring well MW121

These required repair activities will be completed during the fall 2012 sampling round.

2.2 LANDFILL INSPECTIONS

Post-closure monitoring requirements for Landfills L3, L11, and M13 are mandated by Illinois Administrative Code (IAC) Title 5, Subtitle G, Chapter 1, Subchapter c, Part 724, Subpart G for 15 years at Landfill M13 and 30 years at Landfills L3 and M11. The LTM Plan states that the L3 Landfill cover will be inspected quarterly, the M11 Landfill cover will be inspected quarterly for the first five years and annually for 25 years, and the M13 Landfill cover will be inspected quarterly. Objectives include:

- Confirm that the landfill cap has controlled leaching so that water quality will not be threatened in the future;
- Ensure that the cap is maintained in a manner that will not increase infiltration in the future or otherwise allow waste to be exposed;
- Keep survey points protected and visible to facilitate identification in the future.
- At M13 ensure the fence and signage installed to restrict site access remain in place and serviceable; and
- At M13 certify that institutional controls remain in place.

According to IAC and the Final LTM Plan, Landfill L3, M11, and M13 covers will be inspected on a quarterly basis for:

- Depressions indicating subsidence or other deformations that could breach the cover;

- Erosion features;
- Growth of deep rooted vegetation or invasive species that would adversely affect evapotranspiration and/or erosion armoring; and
- Debris or blockage of drainage structure.

In addition, land use restrictions have been imposed across the area within the fence. Annual certification is required to document that none of the following are occurring within the fence:

- Development
- Intrusive work
- Excavation that could mobilize contaminants of concern (COCs)
- Alteration of surface water flow
- Vehicle use other than that associated with maintenance of the cover/cap.

Landfill inspections were conducted on a quarterly basis at landfills L3, M11, and M13 starting in October 2008 in accordance with the LTM Plan. Landfill inspection reports for March and April 2012 are included as Appendices A1 and A2, respectively.

2.2.1 March 2012 Landfill Inspections

Site inspections of Landfills L3, M11, and M13 were conducted on March 1, 2012 in accordance with the LTM Plan. The rip rap along Prairie Creek at Site L3 has been washed away at several locations and is in need of repair. Although small areas of the synthetic cap is exposed at several locations as a result of the rip rap being washed away, the landfill appears to be stable and does not appear to be failing. The remaining rip rap also appears to be stable. The March Post-Closure Inspection Report is included in Appendix A1.

2.2.2 April 2012 Landfill Inspections

Site inspections of Landfills L3, M11, and M13 were conducted on April 18, 2012 in accordance with the LTM Plan. Woody vegetation growing on Landfills L3, M11, and M13 were removed prior to the inspection. The rip rap along Prairie Creek at Site L3 has been washed away at several locations and is in need of repair. Although small areas of the synthetic cap is exposed at several locations as a result of the rip rap being washed away, the landfill appears to be stable and does not appear to be failing. The remaining rip rap also appears to be stable. The April Post-Closure Inspection Report is included in Appendix A2.

2.3 INSTITUTIONAL CONTROLS MONITORING

The remedies selected for all areas of JOAAP do not allow unrestricted use of the property or underlying groundwater. Restrictions on use of groundwater are limited to the GMZs and annual certification that the restrictions are being maintained for each GMZ is required. Land use restrictions over and above those associated with groundwater use apply wherever waste or contamination has been left in place at levels that pose an unacceptable risk without some form of ICs. Some of those areas include the three landfills (L3, M11, and M13) with associated restrictions with annual certification. For all other areas with institutional controls there is a need for similar annual certification that the deed restrictions remain in place and are effective. Annual certifications are completed separate from this report. However, during groundwater monitoring and landfill inspections conducted quarterly at Landfill M13 and site-wide sampling conducted semi-annually in 2012, there were no observations of intrusive soil activities, construction, or improper use of groundwater which would affect the GOU or SOU remedies.

3.0 RESULTS AND RECOMMENDATIONS

Groundwater management zones are three-dimensional areas containing groundwater being managed to mitigate impairment according to IAC. The GMZs comprise both the glacial drift and shallow bedrock (Silurian Dolomite) aquifer and are bounded at depth by a confining shale unit (Maquoketa Shale). The GMZs were established with acceptance of the ROD. Any future modification of GMZ boundaries will have to be mutually agreed upon between the Army, USEPA, and IEPA. Groundwater monitoring wells and surface water collection points located inside and/or near the borders provide monitoring points for contaminant plumes. Site-specific plans for GMZs for GOU sites are discussed in Sections 3.1 through 3.6.

Groundwater and surface water samples collected in February and April 2012 were analyzed for one of more of the following parameters: explosive compounds, TAL metals, indicator parameters (nitrate and sulfate), VOCs, and SVOCs. Analytical results from spring 2012 sampling events for explosive compounds, TAL metals, indicator parameters (nitrate and sulfate), VOCs, and SVOCs are summarized in Tables 3-1 through 3-5, respectively. This section provides a site-specific presentation of the water level measurements and groundwater and surface water quality sampling results. The discussions are arranged by the GMZs into which each of the sites is grouped. This provides an ability to discuss the contaminant detections in relation to each of the GMZ boundaries.

Each site in Section 3 is organized into the following subsections:

General Site Introduction: General site-specific background information is presented along with any information on site monitoring wells and surface water sampling locations and water elevation measurements.

Groundwater Hydraulics: Site or GMZ figures are presented for the water table and potentiometric surface (generally in the bedrock). For groundwater hydraulic purposes, monitoring wells are designated as overburden wells (OVB), combined overburden/bedrock wells (COMBO), or bedrock wells (BRK). This designation indicates in which aquifer(s) the well is screened. When practical, discussions include the relationship between groundwater flow direction, hydraulic gradients, and contaminant migration.

Analytical Results: Figures are presented for contaminant detections observed during the February (Landfill M13) and April 2012 sampling rounds. For groundwater quality discussions, monitoring wells and surface water sampling points are designated as in-plume, early warning, or compliance points and at Landfill sites as upgradient or downgradient. These designations are included in the LTM Plan and are based on the location of the sampling point relative to historic groundwater detections, site GMZ, and/or site features.

Analytical data from 2012 sampling are included in the discussion of analytical results. Contaminant concentrations that are greater than site RGs are included in the discussion even if there is not a notable change in the analytical data for that constituent.

Most Sample Quantitation Limits (SQLs) are less than site RGs; SQLs are provided for each compound in the Data Validation Report (DVR) presented in Appendix B2. In the discussion of analytical results, 'not detected' (ND) implies that the contaminant concentration is less than site RGs. Analytical data are reported to the SQL. If there were detections between the method detection limit (MDL) and the SQL, the quantity would be flagged "J" as estimated concentration (J). The MDLs are less than the RGs.

Recommendations: Recommendations for each site are presented specific to the conditions of the LTM Plan. A summary of recommendations is presented in Section 4. Since there is little evaluation of trends included in the semi-annual reports, the recommendations included herein are general in nature.

3.1 SITE L1

Site L1 is one of six GMZs created to manage risk arising from groundwater contamination and to monitor performance of the selected remedy. Site L1 comprises 80 acres on which munitions production facilities were constructed in 1941. It is centrally located in the northern portion of the LAP Area as can be seen on Figure 1-2. Historically, Site L1 was used for demilitarization and reclamation of various munitions starting with crystallization of ammonium nitrate, but then was converted for shell renovation and 1,3,5-trinitrobenzene (TNB) recovery up until 1945. By April of 1946, it had been reactivated to reclaim TNT.

In the TNT operation, hot water was used to wash the TNT out of shells. The water was discharged to a sump where solid explosives were removed for burning and the overflow (pink water) was routed to a 4.3-acre ridge and furrow evaporation/percolation pond. By 1952, two additional evaporation ponds had been constructed southeast of the ridge and furrow unit on either side of a drainage ditch flowing from it to Prairie Creek. Prairie Creek, the surface water body draining the area, is incised into the bedrock and appears to transmit groundwater that discharges directly or emerges into the streambed by virtue of the head relief available in the open channel.

Explosive residues in soil were observed in the ridge and furrow impoundment, the western most of the two newer ponds, the area south of the washout building, and the soil around the sump. The underlying groundwater contains TNT, TNB, 2,6-dinitrotoluene (2,6-DNT), and royal demolition explosive (RDX) both in the alluvium and in the shallow weathered bedrock, as well as degradation products from those parent compounds, as a result of the infiltration of pink water and possibly continued leaching of explosives in soil. The footprint of remedial goal (RG) exceedances currently extends to the southeast of the source area (in the proximity of MW131) to monitoring well MW173. Soil source control measures at the ridge and furrow pond were conducted in 2005 to 2006. The

contamination is now a legacy groundwater plume continuing to migrate to the southeast towards Prairie Creek, where it is believed to largely discharge into the creek through upwelling. Given these observations, the contaminant footprint is expected to separate from the source area over time and migrate in the alluvium and shallow bedrock until it discharges to Prairie Creek.

The overburden aquifer generally consists of a complex stratification of clay and silt, with some silty gravel observed in the eastern portion of the site near MW174. Overburden generally thins from approximately 20 ft in the north to less than 5 ft in the south and from approximately 15 ft in the east to 5 ft in the west.

3.1.1 Groundwater Hydraulics

The groundwater monitoring network at Site L1 consists of 16 wells: 8 overburden wells, 1 combined overburden/bedrock well, and 7 bedrock wells. Water levels are measured at the groundwater/surface water locations that are sampled (listed below), and at monitoring wells MW171, MW175, MW176, MW177, MW178, MW400, MW610, MW611 and WES2. Monitoring well information and water levels for April are summarized in Table 2-3. The groundwater flow direction in the overburden aquifer is generally toward the southeast as shown on Figure 3-1.

The horizontal gradient in the northern part of Site L1 was calculated to be 0.0118 feet per foot (ft/ft) and in the southern part of Site L1 was calculated to be 0.0126 ft/ft in April (Table 3-6). Using the reported average of 9.2E-06 centimeters per second (cm/sec) for hydraulic conductivity and an assumed porosity of 0.30, the calculated flow velocity in the overburden at Site L1 was approximately 0.0011 feet per day (ft/day) or 0.402 feet per year (ft/yr) in April (Table 3-7). As stated in the LTM Plan, a value of 16 ft/yr will be used to evaluate data from groundwater early warning sample points, which will accommodate heterogeneities present in the overburden aquifer.

Bedrock wells are installed at shallow depths (<10 ft below top of bedrock). The groundwater flow direction in the bedrock aquifer is generally toward the southeast as shown on Figure 3-2. Prairie Creek, the surface water body draining the area, is incised into the bedrock in the southern and central parts of the site and appears to transmit groundwater that discharges directly or upwells into the streambed by virtue of the head relief available in the open channel. There is no evidence that contamination flows beneath Prairie Creek as it has not appeared in monitoring wells to the west. The groundwater elevation at monitoring well MW611 was greater than the elevation of Prairie Creek, indicating a gaining stream scenario. Vertical gradients observed were upward at well nests MW171/MW177, MW172/MW173, and MW401/MW610 and downward at well nest MW178/MW176 in April (Table 3-8).

The overburden and bedrock aquifer flow directions are consistent with flow directions observed historically. Based on groundwater flow data, Prairie Creek is the likely discharge point for shallow groundwater in the vicinity of Site L1.

3.1.2 Analytical Results

Groundwater and surface water sampling points for Site L1 during spring 2012 are summarized in Table 1-1. The following monitoring wells and the surface water sampling location at L1 are sampled for explosives:

- In-Plume – MW131, MW173, and WES1
- Early Warning – MW174 and WES3
- Compliance –surface water sampling point SW550 for the overburden aquifer

Groundwater and surface water samples collected at Site L1 in April 2012 were analyzed for explosive compounds in accordance with Appendix B (QAPP) of the LTM Plan. Explosive compound detections for April 2012 sampling conducted at Site L1 are summarized in Table 3-1 and on Figure 3-3. A brief discussion of analytical results by well type follows.

In-Plume Wells (MW131, MW173, and WES1): At overburden monitoring well MW131, 1,3,5-TNT exceeded the RG at a concentration of 2,200 micrograms per liter (µg/L) for the April sampling event.

At overburden monitoring well MW173, RDX exceeded the RG at a concentration of 10 µg/L and TNT exceeded the RG at a concentration of 12 µg/L for the April sampling event.

At bedrock monitoring well WES1, TNB exceeded the RG at a concentration of 40 µg/L and TNT exceeded the RG at a concentration of 38 µg/L for the April sampling event.

The continued detection of degradation products 2-amino-4,6-dinnitrotoluene (2-A-4,6-DNT) and 4-amino-2,6-dinnitrotoluene (4-A-2,6-DNT) in samples collected from in-plume monitoring wells indicate contaminant reduction is occurring.

Early Warning Wells (MW174 and WES3): At overburden monitoring well MW174 and bedrock well WES3, there were no RG exceedances of explosive compounds for the April sampling event.

Compliance Point (SW550): At surface water sampling point SW550, there were no detections of explosive compounds for the April sampling event.

3.1.3 Recommendations

There are no changes in the monitoring program or network recommended. Sampling at Site L1 should be performed during the Fall 2012 sampling event as outlined in Table 3-9.

3.2 SITE L3/LANDFILL L3

Site L3 is the third of six GMZs created to manage risk arising from groundwater contamination and to monitor performance of the selected remedy. Site L3 comprises approximately 50 acres used as a demolition area directly southwest of Site L2 (Figure 1-2). Landfill L3 (described below) occupies 3.32 acres of the Site L3 area (Figure 3-4). Site L3 is bounded on the west by Prairie Creek, the south by an unnamed tributary of Prairie Creek, and the east by Star Grove Cemetery. Predominant use of the area was for open burning of combustibles and munitions crates, including some materials with low level explosive contamination. An air curtain destructor was constructed at the site to reduce emissions, but was never put into use. There was also a one-acre fire training area at the site, a small depression surrounded by an earthen berm.

Specific burning units included "U" and "L" shaped burn pads and a burn cage on a concrete slab. Geophysical surveys noted a number of metallic anomalies buried around the burn pads. The soil was also found to contain lead and RDX contamination at levels requiring remediation. Berms along Prairie Creek were found to contain lead, chlordane, 2,6-DNT, and phosphate above their respective RGs. It has been posited that the contamination in these berms arises from filling activity in the area when the berms were constructed. Unexploded ordnance may also be present in this area. The remedy selected for the area along Prairie Creek was consolidation and capping into what is now called Landfill L3.

Landfill L3 is located along the western edge of the Site L3 GMZ on the east bank of Prairie Creek, as illustrated on Figure 3-4. The area of Landfill L3 was originally contaminated through import of contaminated fill. However, other waste and contaminated soil have been moved to the Site L3 Landfill as a part of the L3 RA in order to consolidate residual contamination into a smaller footprint. Implementation of the remedy began in 2007 and was completed in 2008.

Landfill L3 is believed to contain metals and explosive residues that could continue to contaminate the underlying groundwater and migrate to Prairie Creek. Because the landfill is bordered by Prairie Creek, any contamination that infiltrates from the filled area would be expected to migrate to Prairie Creek and quickly be discharged as the groundwater flows upward into the surface water body.

Monitoring at Landfill L3 is mandated by IAC Title 5, Subtitle G, Chapter 1, Subchapter c, Part 724, Subpart G for a period of 30 years. Objectives include:

- Confirm that the landfill cap has controlled leaching so that water quality will not be threatened in the future;

- Ensure that the cap is maintained in a manner that will not increase infiltration in the future or otherwise allow waste to be exposed; and

- Keep survey points protected and visible to facilitate identification in the future.

Samples from overburden well MW410 are obtained from a silt layer. Samples from combination well MW630 and bedrock well MW412 are obtained at shallow depths (<10 ft below top of bedrock), while samples from bedrock wells MW631 and MW633 are obtained from intermediate depths (10 to 20 ft below top of bedrock).

3.2.1 Groundwater Hydraulics

The groundwater monitoring network at Site L3/Landfill L3 consists of 11 wells: 4 overburden wells, 2 combined overburden/bedrock wells, and 5 bedrock wells. Water levels are measured at the groundwater/surface water locations that are sampled (listed below), and at monitoring wells MW136, MW137, and MW411. Additionally, the water leve4l was measured in April at Site L2 (which was not sampled in April) monitoring well MW134 to provide horizontal groundwater level control. Monitoring well information and water levels for April are summarized in Table 2-3. Surface water elevation in the northern portion of the site is dictated by the dam located on Prairie Creek just north of Central Road (Figure 3-4). The groundwater flow direction in the overburden aquifer is generally toward the west/southwest as shown on Figure 3-4.

The horizontal gradient in the overburden aquifer at Site L3 was calculated to be 0.0276 ft/ft in April (Table 3-6). Using an average hydraulic conductivity value of 1.6E-03 cm/sec and an assumed porosity of 0.3, the flow velocity in the overburden aquifer at Site L3 was approximately 0.4172 ft/day or 152 ft/yr in April (Table 3-7). There are no wells directly downgradient of MW410 or MW412 from which apparent travel times could be estimated. RDX has been observed in Prairie Creek, indicating it has migrated the intervening distance over the last 50 to 60 years but, because the contamination appears to arise from fill activity in the area, the presence of RDX in Prairie Creek water may represent contamination that started much closer to the stream bank than either of the in-plume monitoring wells. Empirical data at Sites L1 and L2 have suggested transport rates more on the order of 2.5 to 11 ft/yr, but hydraulic conductivity may be higher in the disturbed soil of Site L3 and higher gradients found proximate to the discharge line along Prairie Creek. Accordingly, the larger of the two velocities, 11 ft/yr, is assumed for Site L3.

The groundwater flow direction in the bedrock aquifer is generally toward the west as shown on Figure 3-5. Prairie Creek, the surface water body draining the area, is incised into the bedrock in the southern and central parts of the site and appears to transmit groundwater that discharges directly or upwells into the streambed by virtue of the head relief available in the open channel. There is no evidence that contamination flows beneath Prairie Creek as it has not appeared in monitoring wells to the west. The groundwater elevation at monitoring well MW632 was greater than the elevation of Prairie Creek, indicating a gaining stream scenario. An upward vertical gradient was observed at well nest MW630/MW631 at Site L3 in April (Table 3-8), further supporting a gaining stream scenario.

The overburden and bedrock aquifer flow directions are consistent with flow directions observed historically. Based on groundwater flow data, Prairie Creek is the likely discharge point for all shallow groundwater in the vicinity of Site L3/Landfill L3.

3.2.2 Analytical Results

Groundwater and surface water sampling points for Site L3/Landfill L3 during April 2012 are summarized in Table 1-1. The following monitoring wells and surface water sampling points at L3 are sampled for explosives and TAL metals:

- Upgradient – surface water sampling point SW004, where the creek first touches the GMZ boundary and upstream of the storm water outfall
- In-Plume/Downgradient – MW410 and MW412
- Early Warning/Downgradient – MW630, MW631, and MW633
- Compliance/Downgradient – surface water sampling point SW777 for the overburden aquifer, where the creek leaves the GMZ boundary
- Downgradient - Surface water sampling points SW557, upstream of the landfill drainage swale discharge, and SW558, at the constructed drainage swale along the southwest side of the landfill

Groundwater and surface water samples collected at Site L3/Landfill L3 in April were analyzed for explosive compounds and TAL metals in accordance with Appendix B (QAPP) of the LTM Plan. Explosive compounds detected during April 2012 sampling conducted at Site L3 are summarized in Table 3-1 and illustrated on Figure 3-6. Metals detected during April sampling conducted at L3/Landfill L3 are summarized in Table 3-2. For Landfill L3, the monitoring well locations are classified as upgradient or downgradient locations. Therefore, the same well can represent two separate classifications at Site L3/Landfill L3. A brief discussion of analytical results by well type follows:

Upgradient Point (SW004): At surface water sampling point SW004, there were no detections of explosive compounds or metals RG exceedances for the April sampling event.

In-Plume Wells (MW410 and MW412 {downgradient}): At overburden monitoring well MW410, there were no explosive compound detections or metals RG exceedances for the April sampling event.

At bedrock monitoring well MW412, RDX continued to exceed the RG at a concentration of 120 µg/L for the April sampling event. There were no metals RG exceedances for the April sampling event. The continued detection of degradation products 2-A-4,6-DNT and 4-A-2,6-DNT in samples collected from monitoring well MW412 indicate contaminant reduction is occurring.

Early Warning (downgradient) Wells (MW630, MW631, and MW633): At bedrock monitoring well MW630, there was a RG exceedance for RDX at a concentration of 8.7 ug/L for the April sampling event. There were no metals RG exceedances for the April sampling event.

At bedrock monitoring well MW631, there were no explosive compound detections or metals RG exceedances for the April sampling event.

At bedrock monitoring well MW633, RDX continued to exceed the RG at a concentration of 6.7 µg/L for the April sampling event. There were no metals RG exceedances for the April sampling event.

Compliance (downgradient) Points (SW777): At surface water sampling point SW777, RDX was detected below the RG at a concentration of 0.25 ug/L for the April sampling event. There were no metals RG exceedances for the April sampling event.

Additional Downgradient Points (SW557 and SW558): At surface water sampling point SW557, HMX and RDX were detected below the RG at concentrations of 1.1 ug/L and 3.2 ug/L for the April sampling event, respectively. There were no metals RG exceedances for the April sampling event.

At surface water sampling point SW558, there were no explosive compound detections or metals RG exceedances for the April sampling event.

3.2.3 Recommendations

There are no changes in the monitoring program or network recommended. Sampling at Site L3/Landfill L3 should be performed during the Fall 2012 sampling event as outlined in Table 3-9.

3.3 SITE M1

Site M1, the southern ash pile, is part of the MFG facility (Figure 1-2), but contains unique contaminants not present at actionable levels at any other GMZ. As such, it is singled out as the fifth of the six GMZs. Site M1 comprises 68 acres in the southwestern part of the MFG facility, where from 1965 to 1974, ash residues from the incineration of “red water” (TNT production waste water) were landfilled and placed on unlined soil. At various times (1985, 1993, and 1996) after closure, polyvinyl chloride (PVC) and clay were used to repair erosion damage to the cover.

Groundwater beneath and downgradient of the pile was observed to contain elevated levels of sulfate, 2,6-DNT, and antimony. The latter two compounds exceeded their respective RG on a single sample event only, but the sulfate has exceeded its RG continuously in groundwater and occasionally in surface water. In February 2003, the United States Army

Corps of Engineers (USACE) submitted E*xplanation of Significance Difference Site M1 – Southern Ash Pile* (USACE, 2003), which expanded the northern boundary of the GMZ for Site M1 to encompass concentrations of sulfate in excess of the RG that had migrated beyond the original boundary.

The elevated sulfate is believed to originate in leachate from the Site M1 ash pile that infiltrated through the soil and entered the shallow groundwater. Dissolved sulfate then migrated to the northwest. Sulfate-containing groundwater flows into Prairie Creek, which is located northwest of the former ash pile. Concentrations of sulfate have been measured as high as 46,000 milligrams per liter (mg/L), or over 100 times the RG of 400 mg/L. As recently as 2000, surface water samples were collected that exceeded the RG of 500 mg/L. The ash piles were removed in 2006-2007 eliminating the primary source of sulfate. Consequently, dissolved sulfate in groundwater is now a legacy plume migrating to the northwest.

The overburden aquifer primarily consists of silt and clay, with scarce amounts of sand and silty gravel at the bedrock contact. Sand is abundant in the higher, unsaturated, parts of the site. Over most of Site M1, the overburden thickness is fairly consistent between 15 and 20 ft thick. At the northern end of the site, near MW642/MW641, the overburden consists entirely of silty gravel and the depth to bedrock is greater than 40 ft. The presence of Prairie Creek in the western part of M1 suggests that Prairie Creek is the discharge point for shallow groundwater.

3.3.1 Groundwater Hydraulics

The groundwater monitoring network within this site consists of 18 wells: 10 overburden wells, 4 combined overburden/bedrock wells, and 4 bedrock wells. Water levels are measured at the groundwater/surface water locations that are sampled (listed below), and at monitoring wells MW104, MW105, MW106, MW201, MW347, MW351, and MW647. Monitoring well information and water levels for October are summarized in Table 2-2. The groundwater flow direction in the overburden aquifer is generally to the northwest, as shown on Figure 3-7.

The horizontal gradient at Site M1 was 0.0303 ft/ft in April (Table 3-6). Using an average hydraulic conductivity value of 6.6E-05 cm/sec and an assumed porosity of 0.3, the flow velocity in the overburden aquifer at Site M1 was approximately 0.0189 ft/day or 6.9 ft/yr in April (Table 3-7). However, that would indicate that the plume should be on the order of 80 ft from the ash pile after 40 years of travel time (1965 to 2005). In fact, by 2005, the elevated sulfate levels were observed out to MW645, a distance of 2,060 ft, which suggests a flow velocity of approximately 50 ft/yr.

The groundwater flow direction in the bedrock aquifer is generally toward the northwest, as shown on Figure 3-8. An upward vertical gradient was observed at well nest MW351/MW640 and a downward vertical gradient was observed at well nest MW641/MW642 in April (Table 3-8).

The overburden and bedrock aquifer flow directions are consistent with flow directions observed historically. Based on groundwater flow data, Prairie Creek is the likely discharge point for all shallow groundwater in the vicinity of Site M1.

3.3.2 Analytical Results

Groundwater sampling points for Site M1 during spring 2012 are summarized in Table 1-1. The following monitoring wells and the surface water sampling point at M1 are sampled for sulfate:

- In-Plume – MW107, MW231, MW640, MW641, and MW642
- Early Warning – MW643 and MW644
- Compliance – MW646 for the bedrock aquifer and MW645, MW648, and MW649 and surface water sampling point SW709 where the creek leaves the GMZ boundary for the overburden aquifer

Groundwater and surface water samples collected at Site M1 in April were analyzed for sulfate in accordance with Appendix B (QAPP) of the LTM Plan. Sulfate detections for the April sampling event conducted at Site M1 are summarized in Table 3-3 and shown on Figure 3-9. A brief discussion of analytical results by well type follows:

In-Plume Wells (MW107, MW231, MW640, MW641, and MW642): At monitoring well MW107, sulfate exceeded the RG at a concentration of 26,000 mg/L for the April sampling event.

At monitoring well MW231, sulfate exceeded the RG at a concentration of 35,000 mg/L for the April sampling event.

At monitoring well MW640, sulfate exceeded the RG at a concentration of 5,200 mg/L for the April sampling event.

At monitoring well MW641, sulfate exceeded the RG at a concentration of 640 mg/L for the April sampling event.

At monitoring well MW642, sulfate exceeded the RG at a concentration of 420 mg/L for the April sampling event.

Early Warning Wells (MW643 and MW644): At monitoring wells MW643 and MW644, sulfate was detected at concentrations below the RG for the April sampling event.

Compliance Points (MW645, MW646, MW648, MW649, and SW709): At monitoring wells MW645, MW646, MW648, and MW649 and surface water sampling point SW709, sulfate was detected at concentrations below the RG for the April sampling event.

3.3.3 Recommendations

There are no changes in the monitoring program or network recommended. Sampling at Site M1 should be performed during the Fall 2012 sampling event as outlined in Table 3-9.

3.4 MFG GMZ

The MFG Area is the sixth GMZ, lies in the northwestern part of JOAAP, and was created by the consolidation of several discrete sites including M3, M4, M5, M6, M7, M8, M9, M13, and outlying wells deemed as "Other Areas". The MFG Area GMZ is illustrated on Figure 1-2. Each of these areas hosted unique operations that led to the release of different contaminants. Groundwater contamination consisting of explosive compounds, excluding contamination from Landfill M13, is being managed collectively and is included as Section 3.6. Of the areas, only Sites M6, M9, and M13 continue to have groundwater contamination with COCs in excess of RGs. Each site comprising the MFG GMZ will be independently closed before the MFG GMZ can be eliminated.

Monitoring wells from Sites M6, M7, M9, and Other Areas continue to be included in the MFG groundwater sampling. Numerous monitoring wells are also measured as water level control points at these other sites.

3.4.1 Site M6

Site M6, the TNT Ditch Complex, covers 271 acres to the northwest of Site M5 in the central part of the MFG Area (Figure 1-2) and was largely used for TNT and DNT production during World War II, and then again in the Korean and Vietnam Wars. In between the wars, the facilities were used for research and development of different explosives like nitroxylenes. Production of TNT was terminated in 1977.

Production of TNT was conducted in 12 parallel lines, each containing a full sequence of production steps from the "mono-house" to the "bi-house" and then the "tri-house" buildings. Waste water ("red water") from each "tri-house" and the wash houses was discharged from wooden tanks to clay-lined ditches feeding into the TNT Ditch. In 1965, the original drainage system was replaced by wooden flumes completed in the TNT Ditch and the red water was diverted to Site M7 for treatment. Dintrotoluene production waste water was discharged from wooden tanks into open troughs and ditches that flowed to the storm water sewer system and the TNT Ditch, ultimately flowing untreated into Grant Creek. In addition to normal processing water, the TNT Ditch received drench water used to kill a production run when reactions ran out of control and posed an explosive threat. Between 1972 and 1974, there were more than 30 recorded instances of drenching with the associated discharge of "bi-oil" and concentrated nitric and sulfuric acid.

The full range of nitroaromatic compounds have been found in soil at Site M7, with concentrations of TNT, 2,4-dinitrotoluene (2,4-DNT), lead, arsenic, and beryllium

exceeding their respective RGs. Seven explosive compounds have been observed in the underlying groundwater at concentrations that exceed their respective RGs: TNT, 2,4-DNT, 2,6-DNT, 2-nitrotoluene (2-NT), TNB, nitrobenzene (NB), and RDX.

The overburden aquifer primarily consists of silt and clay, with variable amounts of sand and silty gravel. The overburden thickness ranges from 5 to 30 ft across the site. Based on available information, screens for overburden wells at Site M6 are set in silt and/or clay layers with the exception of monitoring wells MW650 and MW652; which have screens set in a silty gravel layer.

3.4.1.1 Groundwater Hydraulics

The groundwater monitoring network within Site M6 consists of 39 wells: 14 overburden wells, 2 combined overburden/bedrock wells, and 23 bedrock wells. Water levels are measured at the groundwater locations that are sampled (listed below), and at numerous monitoring wells at M6 and sites including M3, M4, M5, M8, M9, and "Other Areas". Monitoring well information and water levels for October are summarized in Table 2-2. The groundwater flow direction in the overburden aquifer is generally toward the west as shown on Figure 3-10.

The horizontal gradient in the northern part of Site M6 was calculated to be 0.0187 ft/ft and in the southern part of Site M6 was calculated to be 0.0225 ft/ft in April (Table 3-6). Using an average hydraulic conductivity value of 8.6E-04 cm/sec and an assumed porosity of 0.30, the flow velocity at Site M6 was approximately 0.1674 ft/day or 61.1 ft/yr in April (Table 3-7). However, at Site M6, COCs have not been detected at wells 600 ft directly downgradient (MW212R to MW123R and MW162R). Given the 60 years that have passed since releases began at Site M6, this suggests the transport time for RDX and TNT is less than 600/60 = 10 ft/yr. A rate of 10 ft/yr is comparable to transport rates calculated for other areas of JOAAP.

The groundwater flow direction in the bedrock aquifer is generally toward the west as shown on Figure 3-11. Screens for bedrock monitoring wells MW123, MW314, MW316, MW318, and MW654 are set at shallow depths (<10 ft below top of bedrock), while screens for monitoring wells MW118, MW119, MW213R, MW215R, MW310R, MW311, MW313, and MW653 are set at intermediate depths within the bedrock aquifer (10 to 20 ft below top of bedrock). Screens for monitoring wells MW312, MW315, MW317, MW320, MW651, and MW655 are set deeper within the bedrock aquifer (>20 ft below top of bedrock). Vertical gradients were generally downward for well nests located along the escarpment, where the former TNT load lines were oriented at Site M6, and were upward in the wetland immediately to the west in April (Table 3-8).

The overburden and bedrock aquifer flow directions are consistent with flow directions observed historically.

3.4.1.2 Analytical Results

Groundwater sampling points for Site M6 during April 2012 are summarized in Table 1-1. The following monitoring wells at M6 and other sites included in the M6 grouping are sampled for explosives:

- In-Plume – MW212R, MW652, and MW330 (M9)
- Early Warning – MW123R, MW162R, MW313, MW318, MW319, and MW654
- Compliance – MW117 and MW118 and MW119 (Other Areas).

Groundwater samples collected at Site M6 in April were analyzed for explosive compounds in accordance with Appendix B (QAPP) of the LTM Plan. Monitoring well MW330 was sampled for sulfate. Explosive compound detections for the April sampling event conducted at Site M6 are summarized in Table 3-1 and shown on Figure 3-12. Sulfate detections the April sampling event conducted at Site M6 are summarized in Table 3-3. A brief discussion of analytical results by well type follows:

In-Plume Wells (MW212R, MW652, and MW330): At monitoring well MW212R, 2,4-DNT (620 µg/L), 2,6-DNT (260 µg/L), and TNT (39 µg/L) exceeded the RG for the April sampling event.

At monitoring well MW652, 2,4-DNT (8,400 µg/L), 2,6-DNT (3,300 µg/L), 2-NT (44,000µg/L), and TNT (1,600 µg/L) exceeded the RG for the April sampling event.

At monitoring well MW330, sulfate exceeded the RG at a concentration of 430 µg/L for the April sampling event.

Early Warning Wells (MW123R, MW162R, MW313, MW318, MW319, and MW654): At monitoring wells MW123R, MW162R, and MW313, there were no RG exceedances of explosive compounds for the April sampling event.

At monitoring well MW318, 2,6-DNT exceeded the RG at a concentration of 0.45 ug/L for the April sampling event.

At monitoring well MW319, there were no RG exceedances of explosive compounds for the April sampling event.

At monitoring well MW654, 2,4-DNT exceeded the RG at a concentration of 1.7 ug/L and 2,6-DNT exceeded the RG at a concentration of 0.97 ug/L for the April sampling event. The continued detection of degradation products 2-A-4,6-DNT and 4-A-2,6-DNT in samples collected from monitoring well MW654 indicate contaminant reduction is occurring.

Compliance Wells (MW117 and MW118 and MW119: At monitoring wells MW117, MW118, and MW119, there were no detections of explosive compounds for the April sampling event.

3.4.1.3 Recommendations

There are no changes in the monitoring program or network recommended. Sampling at Site M6 should be performed during the Fall 2012 sampling event as outlined in Table 3-9.

3.4.2 Site M7

Site M7, the Red Water Area, comprises 49 acres in the central part of the MFG Area between Site M6 and Site M7 on the west bank of the TNT Ditch (Figure 1-2). Facilities at Site M7 included storage tanks, pump stations, evaporators, and incinerators used to destroy the red water from Site M6 after construction in 1965. Overflows of untreated red water were stored in the Red Water Lagoon, a 3.3 acre impoundment that was remediated in 1985.

Contaminants of concern in soil included TNT, 2,4- and 2,6-DNT, TNB, and RDX. Source areas in soil included the drainage areas in the northwest part of Site M7. Soil RA activities were completed in 2001 at Site M7. Contaminants of concern in groundwater include: TNT, 2,4-DNT, 2,6-DNT, and RDX.

The overburden aquifer primarily consists of silt and clay, with some sand and gravel in the upper, unsaturated, part of the aquifer. The overburden thickness ranges from less than 5 to more than 10 ft across Site M7. Based on available information, samples from overburden wells are obtained from discontinuous sand and gravel layers.

3.4.2.1 Groundwater Hydraulics

The groundwater monitoring network at Site M7 consists of 9 wells: 4 overburden wells, 1 combined overburden/bedrock well, and 4 bedrock wells. Water levels are measured at each groundwater location that is sampled (listed below), and at monitoring wells MW156, MW159, MW216, MW217, MW321, MW322, MW660, and MW661. Monitoring well information and water levels for October are summarized in Table 2-2. The groundwater flow direction in the overburden aquifer in the immediate vicinity of Site M7 is generally toward the west/southwest as shown on Figure 3-10.

The horizontal gradient at Site M7 was calculated to be 0.0105 ft/ft in April (Table 3-6). Using an average hydraulic conductivity value of 6.7E-04 cm/sec and an assumed porosity of 0.30, the flow velocity at Site M7 was approximately 0.0665 ft/day or 24 ft/yr in April (Table 3-7).

The groundwater flow direction in the bedrock aquifer in the immediate vicinity of Site M7 is generally toward the west/northwest as shown on Figure 3-11. With the exception of well MW124R, bedrock wells are screened at intermediate depths within the bedrock aquifer (10 to 20 ft below top of bedrock). Bedrock well MW124R and combination well MW157 are screened at a shallow depth within bedrock (<10 ft below top of bedrock). Vertical gradients were calculated for well nests MW216/MW217, MW660/MW661, MW321/MW322, and MW157/MW158 located in the vicinity of Site M7. Calculated vertical gradients were downward at well nests MW321/MW322 and MW660/MW661, upward at well nest MW216/MW217 (located slightly north), and a very low vertical gradient was observed at well nest MW157/MW158 (located in the wetland west of the escarpment) (Table 3-8).

The overburden and bedrock aquifer flow directions are consistent with flow directions observed historically.

3.4.2.2 Analytical Results

Monitoring well MW124R was sampled during April as an early warning bedrock well as part of the MFG monitoring network (Table 1-1).

The groundwater samples collected at Site M7 in 2012 were analyzed for explosive compounds in accordance with Appendix B (QAPP) of the LTM Plan. Explosive compound detections for the April sampling event conducted at Site M7 are summarized in Table 3-1 and shown on Figure 3-12. A brief discussion of analytical results by well type follows.

Early Warning Well (MW124R): At well MW124R, there were no detections of explosive compounds for the April sampling event.

3.4.2.3 Recommendations

There are no changes in the monitoring program or network recommended. Sampling at Site M7 should be performed during the Fall 2012 sampling event as outlined in Table 3-9.

3.5 LANDFILL M11

Landfill M11 is located in the southwestern part of the manufacturing side of JOAAP as illustrated on Figures 1-2. The landfill monitoring area comprises approximately 133 acres. Site M11 was divided into two sections by School House Road and bordered on the west by West Patrol Road. M11 north encompassed approximately 10.5 acres of former gravel pits that were mined and filled with waste. M11 south, a former gravel pit, encompassed approximately 5.6 acres that was also mined and filled with waste. The remedy chosen for M11 was waste consolidation and capping. Implementation of the remedy began in 2006 and was completed in 2008.

The current conceptual site model (CSM) is that M11 is believed to contain manganese and sulfate containing waste that could potentially contaminate underlying groundwater and migrate beyond the GMZ.

With the implementation of the RA at Site M11, it is anticipated that the landfill cap will prevent percolation of precipitation through waste consolidated in the landfill, thus preventing groundwater contamination.

Monitoring at Landfill M11 is mandated by IAC Title 5, Subtitle G, Chapter 1, Subchapter c, Part 724, Subpart G for a period of 30 years. Long-term monitoring of the landfill cap will include quarterly inspections of the cap, vegetation, and drainage structures for the first five years, then annually for 25 years. Objectives include:

- Confirm that the cap has controlled leaching at the landfill so that water quality will not be threatened in the future;
- Ensure that the cap is maintained in a manner that will not increase infiltration in the future or otherwise allow waste to be exposed;
- Keep survey points protected and visible to facilitate identification in the future;

3.5.1 Groundwater Hydraulics

The groundwater monitoring well network at Landfill M11 consists of 13 wells: 3 combination overburden/bedrock wells and 10 bedrock wells. Water levels are measured at the groundwater locations that are sampled (listed below), and at monitoring wells MW108, MW337, MW338, MW339, and MW340. Monitoring well information and water levels for April are summarized in Table 2-2. The groundwater flow direction in the overburden aquifer is generally toward the west as shown on Figure 3-13.

The horizontal gradient at Landfill M11 was 0.0052 ft/ft in April (Table 3-6). Using a hydraulic conductivity of 6.7E-04 cm/sec from nearby Site M7 and an assumed porosity of 0.30, the calculated flow velocity at Landfill M11 was approximately 0.0329 ft/day or 12 ft/yr in April (Table 3-7).

Bedrock is shallow at Landfill M11, ranging from 2.5 to 9 ft below ground surface. The groundwater flow direction in the bedrock aquifer is generally toward the northwest as shown on Figure 3-14. The calculated vertical gradients were upward at upgradient well nest MW802/MW803 and downward at downgradient well nest MW804/MW805 in April (Table 3-8).

The overburden and bedrock aquifer flow directions are consistent with flow directions observed historically.

3.5.2 Analytical Results

Groundwater sampling points for Landfill M11 during spring 2012 are summarized in Table 1-1. The following monitoring wells at Landfill M11 are sampled for VOCs, SVOCs, TAL metals, explosives, nitrate, and sulfate:

- Upgradient – MW802
- Downgradient – MW335, MW336, and MW805

Groundwater samples collected at Landfill M11 in April and were analyzed for explosive compounds, TAL metals, indicator parameters (sulfate and nitrate), VOCs, and SVOCs in accordance with Appendix B (QAPP) of the LTM Plan. Detections for explosive compounds, TAL metals, indicator parameters (sulfate and nitrate), VOCs, and SVOCs for the sampling events conducted at Site M11 in April are summarized in Tables 3-1, 3-2, 3-3, 3-4, and 3-5, respectively. Explosive compound detections are shown on Figure 3-15. Site M11 monitoring well locations are classified as upgradient or downgradient locations. A brief discussion of analytical results by well type follows:

Upgradient (MW802): There were no detections for explosive compounds for the April sampling event.

There were no RG exceedances for metals for the April sampling event.

There were no RG exceedances for nitrate or sulfate for the April sampling event.

There were no detections of VOCs for the April sampling event.

There were no detections of SVOCs for the April sampling event.

Downgradient (MW335, MW336, and MW805): There were no RG exceedances for explosive compounds for the April sampling event.

There were no RG exceedances for metals for the April sampling event.

There were no RG exceedances for nitrate for the April sampling event. There were RG exceedances for sulfate in the samples collected from monitoring wells MW335 (660 mg/L), MW336 (410 mg/L), and MW805 (470 mg/L) for the April sampling event.

There were no detections of VOCs for the April sampling event.

There were no detections of SVOCs for the April sampling event.

3.5.3 Recommendations

There are no changes in the monitoring program or network recommended. Sampling at Landfill M11 should be performed during the Fall 2012 sampling event as outlined in Table 3-9.

3.6 LANDFILL M13

Landfill M13 comprises approximately 106 acres of the central part of the MFG Area known as the gravel pits. It lies north of the Tetryl Production Area, east of the TNT Ditch Complex, and west of the Acid Area (Figure 1-2).

Landfill M13 is located in the northern part of Site M13 and comprises approximately 10.5 acres. Site features at Landfill M13 and surrounding areas are illustrated on Figure 3-16. Disposal activities were confined to four discrete areas on the site, none of which extended beyond 12 acres in size. Historical records indicate landfilling took place in the Northern Gravel Pit during the period 1966 to 1984 and involved scrap metals, creosote-treated railroad ties, telephone poles, and construction/demolition debris. Other waste management activities at Site M13 involved explosives. Explosive compounds observed in the groundwater at Site M13 include: TNT, TNB, 2,4-DNT, and 2,6-DNT.

Soil in the vicinity of the Northern Gravel Pit had been found to contain beryllium, lead, and benzo(a)pyrene as COCs. On a single occasion in 1991, antimony and cadmium were reported to be present in groundwater samples at concentrations in excess of their respective RGs, but they have not exceeded the RGs since. It is difficult to determine if the original findings could have resulted from turbid samples since low flow sampling and micro purging techniques are now employed to obtain more representative samples.

The current CSM is that metals and benzo(a)pyrene in groundwater may be present as a result of leaching of waste materials in the Northern Gravel Pit. The explosives present in groundwater are far more likely to be present due to infiltration of wastewater in the TNT Ditch. There is no evidence to suggest explosive compounds were ever present in waste materials put into the pit.

The Northern Gravel Pit was consolidated and capped (Landfill M13) in the 2007 to 2008 time frame. The three other pits received waste materials that do not appear to pose a threat to human health and the environment.

With the implementation of the RA at the TNT Ditch and the capping of the Northern Gravel Pit, it is anticipated that contaminants in site groundwater will detach from the source areas and migrate as legacy plumes to the west. As such, concentrations are expected to decline with time.

Monitoring at Landfill M13 is mandated by IAC Title 5, Subtitle G, Chapter 1, Subchapter c, Part 724, Subpart G for a period of 15 years. Long-term monitoring of the landfill cap will include quarterly inspections of the cap, vegetation, and drainage structures. Objectives include:

- Confirm that the cap has controlled leaching at the landfill so that water quality will not be threatened in the future;
- Ensure that the cap is maintained in a manner that will not increase infiltration in the future or otherwise allow waste to be exposed;
- Keep survey points protected and visible to facilitate identification in the future;
- Ensure the fence and signage installed to restrict site access remain in place and serviceable; and
- Certify that institutional controls remain in place.

The overburden aquifer primarily consists of silt and clay, with abundant sand and gravel in the upper, unsaturated, portion of the aquifer. The overburden thickness is approximately 25 ft and is fairly consistent across Site M13. Samples from overburden wells are obtained from silt and/or clay layers.

3.6.1 Groundwater Hydraulics

The groundwater monitoring network at Landfill M13 consists of 11 wells: 6 overburden wells, 1 combined overburden/bedrock well and 4 bedrock wells. Water levels are measured at the groundwater locations that are sampled (listed below), and at monitoring wells MW350, MW363, and MW364. Monitoring well information and water levels for February and April are summarized in Table 2-2. The groundwater flow direction in the overburden aquifer for the February and April quarterly sampling events is to the south/southeast as shown on Figures 3-16 and 3-17, respectively. Figure 3-17 includes the surrounding groundwater flow taken from the semi-annual sampling event, as shown on Figure 3-10.

The horizontal gradient at Site M13 was calculated to be 0.0048 ft/ft in February and 0.0047 ft/ft in April (Table 3-6). Using an average hydraulic conductivity value of 8.0E-02 cm/sec and an assumed porosity of 0.30, the calculated flow velocity at Site M13 was approximately 3.6 ft/day or 1,296 ft/yr in February and in April (Table 3-7). Chemical data do not support this high of a flow velocity and linear flow velocities are likely on the order of 10 ft/yr based on data from other sites at JOAAP.

The groundwater flow direction in the bedrock aquifer in the immediate vicinity of Landfill M13 for February and April quarterly sampling events was generally toward the southwest as shown on Figures 3-18 and 3-19. Figure 3-19 includes the surrounding groundwater

flow taken from the April semi-annual sampling event, as shown on Figure 3-11. The screens for combination well MW350 and nearby bedrock well MW321 are set at a shallow depth within the bedrock aquifer (<10 ft below top of bedrock), while the well screen for nearby well MW322 is set at an intermediate depth within the bedrock aquifer (10 to 20 ft below top of bedrock). Downward vertical gradients were observed at upgradient well nest MW806/MW807 in February and April and downgradient well nests MW363/MW364 in February and MW808/MW809 in February and April. An upward vertical gradient was observed at downgradient well nests MW126R/MW362 in February and April and MW363/MW364 in April (Table 3-8).

The overburden and bedrock aquifer flow directions are consistent with flow directions observed historically.

3.6.2 Analytical Results

Groundwater sampling points for Landfill M13 within the MFG GMZ for the spring 2012 sampling events (quarterly) are summarized in Table 2-1. Monitoring wells AEHA14R and AEHA15 were not sampled in Spring 2012 as recommended in the 2010 Annual Report. The following monitoring wells at Landfill M13 are sampled for VOCs, SVOCs, TAL metals, explosives, nitrate, and sulfate:

- Upgradient – MW806 and MW807
- Downgradient – MW126R, MW362, MW808, and MW809

Groundwater samples were collected at Landfill M13 in February and April, 2012 and were analyzed for explosive compounds, TAL metals, indicator parameters (sulfate and nitrate), VOCs, and SVOCs in accordance with Appendix B (QAPP) of the LTM Plan. Detections of explosive compounds, TAL metals, indicator parameters (sulfate and nitrate), VOCs, and SVOCs for the sampling events conducted at Landfill M13 in spring 2012 are summarized in Tables 3-1, 3-2, 3-3, 3-4, and 3-5, respectively. Explosive compound detections are shown on Figure 3-20. For Landfill M13 the monitoring well locations are classified as upgradient or downgradient locations. A brief discussion of analytical results by well type follows:

Upgradient (MW806 and MW807): There were no detections of explosive compounds for the February or April sampling events.

There were no RG exceedances for metals for the February or April sampling events.

There were no RG exceedances for nitrate or sulfate for the February or April sampling events.

There were no RG exceedances for VOCs for the February or April sampling events. However, at monitoring well MW807, carbon disulfide (2.4 ug/L), 1,1-DCA (1.4 µg/L), and cis-1,2-DCE (0.79 µg/L) were detected below their respective RGs.

There were no detections of SVOCs for the February or April sampling events.

Downgradient (AEHA14R, AEHA15, MW126R, MW362, MW808, and MW809): There were no detections of explosive compounds at monitoring wells MW808, or MW809 for the February or April sampling events. At monitoring well MW126R, 2-NT and 4-NT were detected below their respective RGs for the April sampling event.

At monitoring well MW362, 2,4-DNT exceeded the RG for the February (1.5 ug/L) and April (4.9 ug/L) sampling events and 2-NT and 3-NT were detected at concentrations below their respective RGs for the April sampling event. In addition, TNT degradation products 2-A-4,6-DNT and 4-A-2,6-DNT were also detected at MW362 at low concentrations for the February and April sampling events.

At monitoring well AEHA15, iron was detected above the RG at a concentration of 15 mg/L for the February sampling event.

There were no RG exceedances for nitrate or sulfate for the February or April sampling events.

At monitoring well MW126R, trichloroethene was detected at a concentration of 0.23 ug/L below the RG for the April sampling event.

At monitoring well MW362, 2,4-DNT was not detected in February as it was in the explosives analysis, but exceeded the RG at a concentration of 3.3 ug/L in April which confirmed the exceedance in the explosives analysis.

3.6.3 Recommendations

Sampling at Landfill M13 should be performed during quarterly summer and fall 2012 sampling events as outlined in Table 3-9. An evaluation of the 2,4-DNT exceedances detected at monitoring well MW362 will be completed in the 2012 Annual Groundwater Monitoring Report to include analytical data from the remaining 2012 quarterly sampling events. A monitoring well should be installed downgradient of Site M13 to replace monitoring wells AEHA14R and AEHA15.

4.0 SUMMARY OF RECOMMENDATIONS

Recommendations included in previous LTM Plan reports relevant to modifications to the Long-Term Monitoring Program are summarized in Table 4-1. The following presents additional recommendations.

- The monitoring program as outlined in Table 3-9 should be implemented for the Fall 2012 sampling event.

- At Landfill L3 the rip rap along Prairie Creek at Site L3 has been washed away at several locations and is in need of repair.

- A monitoring well should be installed downgradient of Site M13 to replace monitoring wells AEHA14R and AEHA15.

- Required monitoring well repairs summarized in Section 2.1.2 will be completed during the fall 2012 sampling round.

General Notes:
ID = identification
SU = standard units
mS/cm = microsiemens per centimeter
NTU = nephelometric turbidity unit
mg/L = milligrams per liter
°C = degrees Centigrade
mV = millivolt
R = Replacement well
NM = not measured
Redox = reduction/oxidation potential
Wells AEHA14R and AEHA15 were not able to be purged prior to collecting a sample. Therefore stabilization criteria were not measured.

Notes:

Coordinates are Universal Transverse Mercator (UTM), Zone 16 East, North American Datum 1983 (NAD83)

UNKOWN = indicate data not presented on borelogs or provided in RI/FS documentation.

NM = Not Applicable, water levels not measured.

BRK = Bedrock

OVB = Overburden

COMBO = Combination Overburden and Bedrock Well

MSL = Feet relative to mean seal level

BGS = Feet below ground surface

ID = identification

TOC = Top of Casing

General Notes

Water levels measured between April 10 and 13, 2012.

Coordinates are Universal Transverse Mercator (UTM), Zone 16 East, North American Datum 1983 (NAD83)

UNKOWN = indicate data not presented on borelogs or provided in RI/FS documentation.

NM = Not Applicable, water levels not measured.

BRK = Bedrock

OVB = Overburden

COMBO = Combination Overburden and Bedrock Well

MSL = Feet relative to mean seal level

BGS = Feet below ground surface

ID = identification

TOC = Top of Casing

TABLE 2-4

Surface Water Elevations
2012 Semi-Annual Groundwater Monitoring Report
Joliet Army Ammunition Plant
Will County, Illinois

Site	Surface Water Location	Surface Water Elevation	
		Date	ft (MSL)
L1	SW550	4/10/2012	603.85
L3	SW557	4/10/2012	587.96
	SW558	4/10/2012	595.56
	SW777	4/10/2012	588.07(1)
	SW004	4/10/2012	589.43
M1	SW709	4/13/2012	532.71

General Note:

MSL = Mean Sea Level

Footnote:

(1) Surface water elevation not used in production of water table map due to elevation measured being higher than upstream location.

Footnotes:
(1) Project Action Limits (Remedial Goal{RG}) obtained from Worksheet #15 of Appendix B (QAPP) of the *Long Term Monitoring Plan* (Toltest, 2010). IEPA Class II groundwater standards for industrial uses are presented where Class I and Class II standards (potable and industrial uses, respectively) were both available.

General Notes:
Only data collected in 2012 are shown.
< = Result shows laboratory Method Reporting Limit for non-detected results
µg/L = microgram per liter
1,3,5-TNB = 1,3,5-Trinitrobenzene
1,3-DNB = 1,3-Dinitrobenzene
2,4,6-TNT = 2,4,6-Trinitrotoluene
2,4-DNT = 2,4-Dinitrotoluene
2,6-DNT = 2,6-Dinitrotoluene
2-A-4,6-DNT = 2-amino-4,6-Dinitrotoluene
2-NT = 2-Nitrotoluene
3-NT = 3 Nitrotoluene
4-A-2,6-DNT = 4-amino-2,6-Dinitrotoluene
4-NT = 4-Nitrotoluene
Bolded result indicates Project Action Limit (RG) exceedance
DUP = duplicate
F = Concentration below the reported detection limit
HMX = High melting explosive
J = Estimated concentration
LF/VF = Lab Flag/Validation Flag
NB = Nitrobenzene
NJ = presumptive evidence that compound concentration is estimated
NS = No standard
RDX = Royal demolition explosive
U = Not detected
UJ = Not detected, estimated detection limit

Footnotes:

(1) Project Action Limits (Remedial Goal {RG}) obtained from Worksheet #15 of Appendix B (QAPP) of the *Long Term Monitoring Plan* (Toltest, 2010). IEPA Class II groundwater standards for industrial uses are presented where Class I and Class II standards (potable and industrial uses, respectively) were both available.

General Notes:

An abbreviated list of analytes is used for reporting based on historically detected and reported compounds.
< = Result shows laboratory Method Reporting Limit for non-detected results
Bolded result indicates Project Action Limit (RG) exceedance
DUP = duplicate
F = Concentration below the reported detection limit
J = Estimated concentration
LF/VF = Lab Flag/Validation Flag
mg/L = milligrams per liter
NS = No standard
U = Not detected
UJ = Not detected, estimated detection limit

Average for MFG Sites M6, M7, and M13	2.7E-02	NM	0.0119	0.3	NM	NM	0.0004	1.2619
Landfill M11[(4)]	6.7E-04	NM	0.0052	0.3	NM	NM	0.00001	0.0329

General Notes:

Hydraulic conductivity values are averages for the overburden aquifer.

Horizontal gradients are calculated using water table elevation data.

K = Hydraulic Conductivity

NM = Water levels not measured.

MFG = Manufacturing Area Sites.

cm/sec = centimeters per second

ft = feet

Foornotes:

(1) Average of north and south gradients at L1 used for April measurements.

(2) No hydraulic conductivity data were available for Site L3. Values used are from nearby Site L2.

(3) Average of north and south gradients at M6 used for April measurements.

(4) No hydraulic conductivity data were available for Site M11 Landfill. Value used is from nearby Site M7.

Notes:

$$\text{Vertical Gradient} = \frac{\text{Water Level in Deep Well - Water Level in Shallow Well}}{\text{ABS (Water Table Elevation - Screen Midpoint of Deep Well)}}$$

Negative vertical gradients indicate downward flow, positive indicates upward flow.

ft = feet

ft/ft = feet per foot

MSL = mean sea level

NM = not measured

ID = identification

MFG = Manufacturing Area Sites

V - Volatile Organic Compounds (VOCs)
SVOC - Semivolatile organic compounds
E - Explosives
M - Metals
I - Indicator parameters (Nitrate-N and Sulfate)
S - Sulfate
MFG - Manufacturing Area

Footnotes:
(1) Site M13 Landfill monitoring wells are sampled quarterly for these parameters in compliance with Illinois Administrative Code.

TABLE 4-1

Summary of Recommendations
2012 Semi-annual Groundwater Monitoring Report
Joliet Army Ammunition Plant
Will County, Illinois

Report	Recommendation	Reasoning	Status Initiated/Pending
2009 Semi-annual			
	No recommendations regarding the monitoring program		
2009 Annual			
	Fall Sampling only at L2	Section 4.1.2.5 of LTM Plan, round with highest concentration	Initiated, Site L2 will not be sampled spring 2012
	Remove TAL metals analysis from Site L3 well MW410	No metals exceedances since sampling re-initiated in spring 2008	Initiated, metals at well MW410 were not sampled beginning fall 2011
	Remove Site M5 well MW207R from monitoring program	Section 4.1.7.4 of LTM Plan, no RG exceedances for 4 rounds	Initiated, well MW207R was not sampled beginning fall 2011
	Remove Site M3 wells MW233 and MW352 from monitoring program	Section 4.1.6.5 of LTM Plan, no RG exceedances for 4 rounds	Initiated, wells MW233 and MW352 were not sampled beginning fall 2011
	Prepare closure report for Site M3	Section 4.1.6.6 of LTM Plan, no RG exceedances for 4 rounds	Closure Report will be prepared in 2013
2010 Semi-annual			
	Remove Site L2 well MW501 from monitoring program	Section 4.1.2.5 of LTM Plan, no RG exceedances for 4 rounds	Initiated, well MW501 was not sampled fall beginning 2011
	Fall Sampling only at L14	Section 4.1.4.5 of LTM Plan, round with highest concentration	Initiated, Site L14 will not be sampled spring 2012
	Prepare closure report for Site M5	Section 4.1.7.4 of LTM Plan, no RG exceedances for 4 rounds	Closure Report will be prepared in 2013
	Remove cadmium analysis from Site M6 well MW123R	Section 4.1.7.4 of LTM Plan, no cadmium detections	Initiated, cadmium at well MW123R was not analyzed beginning fall 2010
2010 Annual			
	Remove Site L1 compliance well MW401 from monitoring program	No explosives detections. Site has upgradient early warning wells with no detections	Initiated, well MW401 will not be sampled beginning spring 2012
	Remove Site L1 early warning well MW172 from monitoring program	Well MW172 redundant with well MW173, upward vertical gradients	Initiated, well MW172 will not be sampled beginning spring 2012
	Change designation of Site L1 well MW173 to in-plume	Migration of contaminants	Initiated in 2011 Annual Report
	Remove Site L2 compliance well MW810 from monitoring program	No explosives detections. Site had upgradient early warning wells with no detections	Initiated, L2 is no longer sampled in spring and well MW810 will not be sampled in fall 2012
	Remove Site L3 compliance well MW632 from monitoring program	No explosives detections. Hydraulics suggest well not within migration flowpath	Initiated, well MW632 will not be sampled beginning spring 2012
	Change designation of Site M1 wells MW640, MW641, and MW642 to in-plume	Migration of contaminants	Initiated in 2011 Annual Report
	Remove Site M8 in-plume well MW148RR from monitoring program	In-plume well with no sulfate exceedances since spring 2009	Initiated, well MW148RR will not be sampled beginning spring 2012
	Remove Site M13 wells AEHA14R and AEHA15 from monitoring program and abandon	Problematic wells	Initiated, wells AEHA14R and AEHA15 will not be sampled beginning spring 2012
2011 Semi-annual			
	No new recommendations		
2011 Annual			
	At Site L3/Landfill L3 sample SW004 in spring only	Upstream sample SW555 provides data for fall rounds	Initiated, SW004 will no longer be sampled in fall when Site L2 is sampled
	Rip rap along Prairie Creek at Site L3 required repair	Rip rap has been washed away at some locations	Pending
	Remove Site Landfill L3/Landfill L3 upgradient well MW03 from monitoring program	No RG exceedances at Site L3 in-pume well MW410	Initiated, well MW03 will not be sampled beginning spring 2012
	Remove Site L14 in-plume well MW508 from monitoring program	No RG exceedances	Initiated, well MW508 will not be sampled beginning spring 2012
	Remove Site L14 compliance wells MW603 and MW604 from monitoring program	Redundant, no RG exceedances in early warning well H7	Initiated, wells MW603 and MW604 will not be sampled beginning spring 2012
	Remove MFG compliance wells MW115 and MW116 from monitoring program	Redundant, no RG exceedances in upgradient Site M6 early warning wells MW123R and MW162R or Site M7 early warning well MW124R	Initiated, wells MW115 and MW116 will not be sampled beginning spring 2012
	Remove MFG compliance wells MW112 and MW113 from monitoring program	Removal of upgradient Site M5 in-plume well MW207R from monitoring program and Site M5 closure	Initiated, wells MW112 and MW113 will not be sampled beginning spring 2012
	Prepare closure report for Site M8	Removal of in-plume well MW148RR from monitoring program	Closure Report will be prepared in 2013
	Fall Sampling only at M11	Section 4.2.2.5 of LTM Plan, stable and predictable results	Pending, recommendation has not been approved. However wells MW333, MW334, MW803, and MW804 will not be sampled in spring 2012
2012 Semi-annual			
	Rip rap along Prairie Creek at Site L3 required repair	Rip rap has been washed away at some locations	Pending
	Install monitoring well downgradient of Site M13 to replace monitoring wells AEHA14R and AEHA15	Monitoirng wells AEHA14R and AEHA15 removed from monitoring program.	Pending

Notes:
Does not include minor maitenance activities such as replacing well locks.
Does not include recommendations repeated in subsequent reports.

- GROUNDWATER MANAGEMENT ZONE BOUNDARY

NOTES

1. BASE MAP DEVELOPED FROM AN AERIAL PHOTOGRAPH OBTAINED FROM WEBSITE HTTP://TERRASERVER-USA.COM, DATED APRIL 10, 2002.
2. COORDINATE SYSTEM BASED ON: DATUM UTM FEET, ZONE 16 (EAST), NAD83.
3. WATER LEVELS MEASURED BY TOLTEST/MWH PERSONNEL ON APRIL 11 AND 12, 2012.
4. MONITORING WELLS USED TO CREATE THE POTENTIOMETRIC SURFACE MAP ARE SHOWN WITH ELEVATIONS.

NOTES

1. REMEDIATION GOAL (PROJECT ACTION LIMITS) OBTAINED FROM WORKSHEET #15 OF APPENDIX B (QAPP) OF THE FINAL LONG TERM MONITORING PLAN (TOLTEST, 2010). IEPA CLASS II GROUNDWATER STANDARDS FOR INDUSTRIAL USES ARE PRESENTED WHERE CLASS I AND CLASS II STANDARDS (POTABLE AND INDUSTRIAL USES, RESPECTIVELY) WERE BOTH AVAILABLE.
2. BASE MAP DEVELOPED FROM AN AERIAL PHOTOGRAPH OBTAINED FROM WEBSITE HTTP://TERRASERVER-USA.COM, DATED APRIL 10, 2002.
3. COORDINATE SYSTEM BASED ON: DATUM UTM FEET, ZONE 16 (EAST), NAD83.
4. SAMPLES COLLECTED BY TOLTEST/MWH PERSONNEL IN FEBRUARY, MARCH, AND APRIL 2012.
5. CONCENTRATIONS REPORTED IN MICROGRAMS PER LITER (µg/L).
6. BOLDED VALUE INDICATES RG EXCEEDANCE.
7. APPROXIMATE LIMITS OF LANDFILL OBTAINED FROM A DRAWING, "M13 NEW WELL LOCATIONS", FIGURE 1, PROJECT NO. 7-61M-11686, PREPARED BY AMEC EARTH & ENVIRONMENTAL, DATED MAY 2008.

POST-CLOSURE INSPECTION REPORT

1.0 Introduction

This document has been prepared for the United States Army Environmental Command to provide documentation of the conditions of three landfills (L3, M11, and M13) located at the former Joliet Army Ammunition Plant (JOAAP).

Post-closure monitoring requirements for Landfills L3, M11 and M13 are mandated by Illinois Administrative Code (IAC) Title 5, Subtitle G, Chapter 1, Subchapter c, Part 724, Subpart G for a period of 30 years. Objectives include:

- Confirm that the landfill cap has controlled leaching so that water quality will not be threatened in the future;
- Ensure that the cap is maintained in a manner that will not increase infiltration in the future or otherwise allow waste to be exposed; and
- Keep survey points protected and visible to facilitate identification in the future.

1.1 Landfill Cover Maintenance

According to IAC, the Landfills L3, M11 and M13 covers will be inspected on a quarterly basis for:

- Depressions indicating subsidence or other deformations that could breach the cover;
- Erosion features;
- Growth of deep rooted vegetation or invasive species that would adversely affect evapotranspiration and/or erosion armoring; and
- Debris or blockage of drainage structures.

Any damages or changes noted will be repaired to comply with the final design specifications for the cover.

Site inspections were conducted on 1 March 2012 for landfill M13, M11 and L3. This report includes copies of the inspection checklist, photographs, recommendations, and conclusions. The Post-Closure Inspection Checklists are found in Attachment A, and Inspection Photographs are found in Attachment B.

2.0 Landfill Descriptions

2.1 Landfill L3

Landfill L3 is located on the western edge of the Site L3 GMZ on the east bank of Prairie Creek. The GMZ comprises approximately 50 acres used as a demolition area directly southwest of Site L2, of which the landfill occupies only 3.32 acres. The area of Landfill L3 was originally contaminated through import of contaminated fill. However, other waste and contaminated soil have been moved to the site as a part of the L3 RA in order to consolidate residual contamination into a smaller footprint. The remedy selected for the consolidated area along Prairie Creek was capping to form Landfill L3. Implementation of the remedy began in 2007 and was completed in 2008.

Landfill L3 is believed to contain metals and explosive residues that could continue to contaminate the underlying groundwater and migrate to Prairie Creek. Because the landfill is bordered by Prairie Creek, any contamination that infiltrates from the filled area would be expected to migrate to Prairie Creek and quickly be discharged as the groundwater flows upward into the surface water body.

2.1.1 Monitoring Locations

Both groundwater and surface water sample points are monitored at Landfill L3 during spring and fall sampling rounds as follows:

- Upgradient Locations
  - SW004 (Surface location where Prairie Creek first enters the L3 GMZ boundary and upstream of the storm water outfall, spring only).
- Downgradient Locations
  - MW410
  - MW412
  - MW630
  - MW631
  - MW633
  - SW777 (Surface water location in Prairie Creek near the L3 GMZ boundary)
  - SW557 (Surface water location in Prairie Creek just upstream of the landfill drainage swale discharge)
  - SW558 (Surface water location at the constructed drainage swale along the southwest side of the newly constructed landfill)

2.2 Landfill M11

Landfill M11 is located in the southwestern portion of the manufacturing side of JOAAP. The GMZ comprises approximately 133 acres. Site M11 was divided into two sections by School House Road and bordered on the west by West Patrol Road. M11 north encompassed approximately 10.5 acres of former gravel pits that were mined and filled with waste. M11 south, a former gravel pit, encompassed approximately 5.6 acres that was also mined and filled with waste. The remedy chosen for Landfill M11 was waste consolidation and capping. Implementation of the remedy began in 2006 and was completed in 2008.

The current conceptual site model is that Landfill M11 is believed to contain manganese and sulfate containing waste that could potentially contaminate underlying groundwater and migrate beyond the GMZ.

With the implementation of the RA at Site M11, it is anticipated that the landfill cap will prevent percolation of precipitation through waste consolidated in the landfill thus, preventing groundwater contamination.

2.2.1 Monitoring Locations

Groundwater sample points are monitored at Landfill M11 in fall as follows:

- Upgradient Locations
  - MW802
  - MW803
- Downgradient Locations

- MW333
- MW334
- MW335
- MW336
- MW804
- MW805

In April 2012 samples will be collected from wells MW802, MW335, MW336, and MW805 only.

2.3 Landfill M13

Landfill M13 comprises approximately 106 acres of the central portion of the MFG Area known as the gravel pits. It lies north of the Tetryl Production Area, east of the TNT Ditch Complex, and west of the Acid Area. Disposal activities were confined to four discrete areas on the site, none of which extended beyond 12 acres in size. Historical records indicate landfill disposal took place in the Northern Gravel Pit during the period 1966 to 1984 and involved scrap metals, creosote-treated railroad ties, telephone poles, and construction/demolition debris. The three other pits received waste materials that do not appear to pose a threat to human health and the environment.

Soil in the vicinity of the Northern Gravel Pit had been found to contain beryllium, lead, and benzo(a)pyrene as COCs. Explosive compounds that have been observed in groundwater at Site M13 include: TNT, TNB, 2,4-DNT, and 2,6-DNT. On a single occasion in 1991, antimony and cadmium were reported to be present at concentrations in excess of their respective RGs, but they have not exceeded the RGs since then. It is difficult to determine if the original findings could have resulted from turbid samples since low flow sampling and micro purging techniques are now employed to obtain more representative samples.

The current conceptual site model is that metal and benzo(a)pyrene in groundwater may be present as a result of leaching of waste materials in the Northern Gravel Pit. The explosives present in groundwater are far more likely to be present due to infiltration of wastewater in the TNT Ditch. There is no evidence to suggest explosive compounds were ever present in waste materials put into the pit.

With the implementation of the RA on the TNT Ditch and the capping of the Northern Gravel Pit, it is anticipated that contaminants in site groundwater will detach from the source areas and migrate as legacy plumes to the west. As such, concentrations are expected to decline with time.

2.3.1 Monitoring Locations

Groundwater is monitored quarterly through sample collection and analysis at six monitoring wells:

- Upgradient or background wells
  - MW806
  - MW807
- Crossgradient
  - MW126R
  - MW362
- Downgradient or source control wells

- MW808
- MW809

3.0 Inspection Results

The following are the observations from the landfill inspections conducted at L3, M11, and M13 on 1 March 2012.

3.1 Landfill L3

The perimeter fence and site postings were in good condition. The vegetative cover was well established and no erosion or woody plants were observed. No subsidence was observed nor was there any evidence of damage due to burrowing animals.

The rip rap along Prairie Creek at Site L3 has been washed away at several locations and is in need of repair. Although small areas of the synthetic cap is exposed at several locations as a result of the rip rap being washed away, the landfill appears to be stable and does not appear to be failing. The remaining rip rap also appears to be stable.

3.2 Landfill M11

The perimeter fence, gate and site postings were in good condition. The vegetative cover was well established and no erosion or woody plants were observed. The rip rap along the perimeter was evenly applied and no erosion channels were detected. There was no evidence of damage due to burrowing animals. The vents were undamaged and appeared to be in working order.

3.3 Landfill M13

The perimeter fence, gate and site postings were in good condition. The vegetative cover was well established and no erosion or woody plants were observed. The rip rap along the perimeter was evenly applied and no erosion channels were detected. The vents were undamaged and appeared to be in working order.

4.0 Conclusions and Recommendations

The deficiencies noted within this report which need to be addressed include the following:

Landfill L3:

- Repair rip rap along Prairie creek.

Landfill M11:

- None detected

Landfill M13:

- None detected.

POST-CLOSURE INSPECTION REPORT

1.0 Introduction

This document has been prepared for the United States Army Environmental Command to provide documentation of the conditions of three landfills (L3, M11, and M13) located at the former Joliet Army Ammunition Plant (JOAAP).

Post-closure monitoring requirements for Landfills L3, M11 and M13 are mandated by Illinois Administrative Code (IAC) Title 5, Subtitle G, Chapter 1, Subchapter c, Part 724, Subpart G for a period of 30 years. Objectives include:

- Confirm that the landfill cap has controlled leaching so that water quality will not be threatened in the future;
- Ensure that the cap is maintained in a manner that will not increase infiltration in the future or otherwise allow waste to be exposed; and
- Keep survey points protected and visible to facilitate identification in the future.

1.1 Landfill Cover Maintenance

According to IAC, the Landfills L3, M11 and M13 covers will be inspected on a quarterly basis for:

- Depressions indicating subsidence or other deformations that could breach the cover;
- Erosion features;
- Growth of deep rooted vegetation or invasive species that would adversely affect evapotranspiration and/or erosion armoring; and
- Debris or blockage of drainage structures.

Any damages or changes noted will be repaired to comply with the final design specifications for the cover.

Site inspections were conducted on 18 April 2012 for landfill M13, M11 and L3. This report includes copies of the inspection checklist, photographs, recommendations, and conclusions. The Post-Closure Inspection Checklists are found in Attachment A, and Inspection Photographs are found in Attachment B.

2.0 Landfill Descriptions

2.1 Landfill L3

Landfill L3 is located on the western edge of the Site L3 GMZ on the east bank of Prairie Creek. The GMZ comprises approximately 50 acres used as a demolition area directly southwest of Site L2, of which the landfill occupies only 3.32 acres. The area of Landfill L3 was originally contaminated through import of contaminated fill. However, other waste and contaminated soil have been moved to the site as a part of the L3 RA in order to consolidate residual contamination into a smaller footprint. The remedy selected for the consolidated area along Prairie Creek was capping to form Landfill L3. Implementation of the remedy began in 2007 and was completed in 2008.

Landfill L3 is believed to contain metals and explosive residues that could continue to contaminate the underlying groundwater and migrate to Prairie Creek. Because the landfill is bordered by Prairie Creek, any contamination that infiltrates from the filled area would be expected to migrate to Prairie Creek and quickly be discharged as the groundwater flows upward into the surface water body.

2.1.1 Monitoring Locations

Both groundwater and surface water sample points are monitored at Landfill L3 during spring and fall sampling rounds as follows:

- Upgradient Locations
  - SW004 (Surface location where Prairie Creek first touches the L3 GMZ boundary and upstream of the storm water outfall, spring only).
- Downgradient Locations
  - MW410
  - MW412
  - MW630
  - MW631
  - MW633
  - SW777 (Surface water location in Prairie Creek near the L3 GMZ boundary)
  - SW557 (Surface water location in Prairie Creek just upstream of the landfill drainage swale discharge)
  - SW558 (Surface water location at the constructed drainage swale along the southwest side of the newly constructed landfill)

2.2 Landfill M11

Landfill M11 is located in the southwestern portion of the manufacturing side of JOAAP. The GMZ comprises approximately 133 acres. Site M11 was divided into two sections by School House Road and bordered on the west by West Patrol Road. M11 north encompassed approximately 10.5 acres of former gravel pits that were mined and filled with waste. M11 south, a former gravel pit, encompassed approximately 5.6 acres that was also mined and filled with waste. The remedy chosen for Landfill M11 was waste consolidation and capping. Implementation of the remedy began in 2006 and was completed in 2008.

The current conceptual site model is that Landfill M11 is believed to contain manganese and sulfate containing waste that could potentially contaminate underlying groundwater and migrate beyond the GMZ.

With the implementation of the RA at Site M11, it is anticipated that the landfill cap will prevent percolation of precipitation through waste consolidated in the landfill thus, preventing groundwater contamination.

2.2.1 Monitoring Locations

Groundwater sample points are monitored at Landfill M11 in fall as follows:

- Upgradient Locations
  - MW802
  - MW803
- Downgradient Locations

- MW333
- MW334
- MW335
- MW336
- MW804
- MW805

In April 2012 samples were collected from wells MW802, MW335, MW336, and MW805 only.

2.3 Landfill M13

Landfill M13 comprises approximately 106 acres of the central portion of the MFG Area known as the gravel pits. It lies north of the Tetryl Production Area, east of the TNT Ditch Complex, and west of the Acid Area. Disposal activities were confined to four discrete areas on the site, none of which extended beyond 12 acres in size. Historical records indicate landfill disposal took place in the Northern Gravel Pit during the period 1966 to 1984 and involved scrap metals, creosote-treated railroad ties, telephone poles, and construction/demolition debris. The three other pits received waste materials that do not appear to pose a threat to human health and the environment.

Soil in the vicinity of the Northern Gravel Pit had been found to contain beryllium, lead, and benzo(a)pyrene as COCs. Explosive compounds that have been observed in groundwater at Site M13 include: TNT, TNB, 2,4-DNT, and 2,6-DNT. On a single occasion in 1991, antimony and cadmium were reported to be present at concentrations in excess of their respective RGs, but they have not exceeded the RGs since then. It is difficult to determine if the original findings could have resulted from turbid samples since low flow sampling and micro purging techniques are now employed to obtain more representative samples.

The current conceptual site model is that metal and benzo(a)pyrene in groundwater may be present as a result of leaching of waste materials in the Northern Gravel Pit. The explosives present in groundwater are far more likely to be present due to infiltration of wastewater in the TNT Ditch. There is no evidence to suggest explosive compounds were ever present in waste materials put into the pit.

With the implementation of the RA on the TNT Ditch and the capping of the Northern Gravel Pit, it is anticipated that contaminants in site groundwater will detach from the source areas and migrate as legacy plumes to the west. As such, concentrations are expected to decline with time.

2.3.1 Monitoring Locations

Groundwater is monitored quarterly through sample collection and analysis at six monitoring wells:

- Upgradient or background wells
  - MW806
  - MW807
- Cross Gradient
  - MW126R
  - MW362

- Downgradient or source control wells
  - MW808

3.0 Inspection Results

The following are the observations from the landfill inspections conducted at L3, M11, and M13 on 18 April 2012.

3.1 Landfill L3

The perimeter fence and site postings were in good condition. The vegetative cover was well established and no erosion was observed. All woody plants observed on the landfill cap during the inspection were cut and removed. No subsidence was observed nor was there any evidence of damage due to burrowing animals.

The rip rap along Prairie Creek at Site L3 has been washed away at several locations and is in need of repair. Although small areas of the synthetic cap is exposed at several locations as a result of the rip rap being washed away, the landfill appears to be stable and does not appear to be failing. The remaining rip rap also appears to be stable.

3.2 Landfill M11

The perimeter fence, gate and site postings were in good condition. The vegetative cover was well established and no erosion was observed. All woody plants observed on the landfill cap during the inspection were cut and removed. The rip rap along the perimeter was evenly applied and no erosion channels were detected. There was no evidence of damage due to burrowing animals. The vents were undamaged and appeared to be in working order.

3.3 Landfill M13

The perimeter fence, gate and site postings were in good condition. The vegetative cover was well established and no erosion was observed. All woody plants observed on the landfill cap during the inspection were cut and removed. The rip rap along the perimeter was evenly applied and no erosion channels were detected. The vents were undamaged and appeared to be in working order.

4.0 Conclusions and Recommendations

The deficiencies noted within this report which need to be addressed include the following:

Landfill L3:

- Repair rip rap along Prairie creek. The Army is currently preparing the contract documentation necessary for implementation of the repairs.
- Some woody plants were observed on the landfill cap during the inspection and were cut and removed.

Landfill M11:

- Some woody plants were observed on the landfill cap during the inspection and were cut and removed.

Landfill M13:

- Some woody plants were observed on the landfill cap during the inspection and were cut and removed.

DATA USABILITY SUMMARY

1.0 INTRODUCTION

The following data usability summary discusses quality assurance/quality control (QA/QC) outliers for each analyte group per sampling round. Data qualifiers were added to results and imported into the Joliet Army Ammunition Plant (JOAAP) database. Data qualifiers used in the validation process may include the following:

- U – Not detected. This validation qualifier was added if there was blank contamination and the sample concentration was less than five times the blank concentration (ten times for common organic contaminants methylene chloride, acetone, phthalates)
- J – Estimated value. This validation qualifier was added if the reported concentration is estimated.
- UJ – Not detected, estimated quantitation limit. This validation qualifier was added if the analyte was not detected but QA/QC parameters were not met.
- R – Unusable data. This validation qualifier was added if the analyte was not detected but QA/QC parameters were not met and were extremely low (i.e. less than 10% recovery for laboratory control samples (LCS) or surrogate recoveries)

Test America Laboratories, Inc. (Test America) located at 2417 Bond Street, University Park, Illinois performed the analyses of groundwater and surface water samples collected in February and April 2012 at the JOAAP located in Wilmington, Illinois. Groundwater was collected from site M13 Landfill and analyzed for the following parameters in February 2012:

- Volatile organic compounds (VOCs) were analyzed by SW846 Method 8260B.
- Semivolatile organic compounds (SVOCs) were analyzed by SW846 Method 8270C.
- Explosives were analyzed by SW846 Method 8330.
- Target analyte list (TAL) metals were analyzed by SW846 Methods 6010B and 7470A (mercury).
- Sulfate was analyzed by United States Environmental Protection Agency (USEPA) Method 300.0.
- Nitrate was analyzed by USEPA Method 300.0.

Groundwater was collected from nine sites and analyzed for the following parameters in April 2012:

- VOCs were analyzed by SW846 Method 8260B at Sites M3, M11 Landfill and M13 Landfill.

- SVOCs were analyzed by SW846 Method 8270C at Sites M11 Landfill and M13 Landfill.
- Explosives were analyzed by SW846 Method 8330 at Sites M5, M6, M7, L1, L2, L3, L14, OA, L3 Landfill, M11 Landfill, and M13 Landfill.
- TAL metals were analyzed by SW846 Methods 6010B and 7470A at Sites L2, L3, L3 Landfill, M11 Landfill, and M13 Landfill.
- Sulfate was analyzed by USEPA Method 300.0 at Sites M1, M8, M9, M11 Landfill and M13 Landfill.
- Nitrate was analyzed by USEPA Method 300.0 at Sites M11 Landfill and M13 Landfill.

Surface water was collected from three sites at JOAAP and analyzed for the following parameters:

- Explosives were analyzed by SW846 Method 8330 at Sites L1, L2, L3, and L3 Landfill.
- TAL metals were analyzed by SW846 Methods 6010B and 7470A at Sites L1 and L3 Landfill.
- Sulfate was analyzed by USEPA Method 300.0 at Site M1.

Field parameters are not discussed in this data usability report, but were recorded by field personnel with a water quality meter at the time of sample collection and included:

- pH, temperature, specific conductivity, dissolved oxygen, turbidity, and oxidation/reduction potential (ORP)

The following summarizes the sample delivery group (SDG) and corresponding data validation report:

Sample Delivery Group	**Data Validation Report Number**	**Associated Samples**

2.0 LABORATORY QA/QC ELEMENTS

Laboratory Data Consultants, Inc. (LDC) located at 7750 El Camino Real, Suite 2L, Carlsbad, California performed the equivalent of USEPA Level III validation on 100% of the data using the JOAAP Quality Assurance Project Plan (QAPP) for Long Term Monitoring, a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review, the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review, and the Department of Defense Quality Systems Manual for Environmental Laboratories validation guidelines, as appropriate. QAPP Worksheets # 34, #35, and #36 describe the verification process and QAPP Worksheet #37 describes the data usability assessment.

Data were evaluated for precision, accuracy, representativeness, comparability, and completeness based on results of the following QA/QC samples and parameters, where applicable:

- Sample preservation
- Sample holding times
- Surrogate spikes (organics)
- Laboratory control sample (LCS/LCSD)
- Matrix spike/matrix spike duplicate (MS/MSD)
- Matrix duplicate (MD) for metals
- Laboratory duplicate samples
- Gas chromatography/mass spectroscopy (GC/MS) tunes (organics)
- Internal standards (organics)
- Initial calibration (ICAL) standards
- Initial calibration verification (ICV) standards
- Continuing calibration verification (CCV) standards
- Interference check samples (ICSs) (metals)
- Trip blanks (VOCs)
- Serial dilution (metals)
- Method blanks
- Initial calibration blanks (ICBs)
- Continuing calibration blanks (CCBs)

The following field QA/QC samples were collected and analyzed:

- One field duplicate per 10 field samples collected
- One MS/MSD (extra sample volume) per 20 field samples collected
- Trip blanks included with each cooler containing VOC samples.

Samples were stored in coolers on wet ice, transported, and hand delivered to the analytical laboratory under chain-of-custody documentation.

3.0 EVALUATION OF MEASUREMENT QUALITY OBJECTIVES

For each analytical method, laboratory QA/QC results were compared to the established acceptance limits. The parameters reviewed for each are outlined in the following subsections.

3.1 PRECISION

Precision was quantitatively evaluated by reviewing the relative percent differences (RPDs) for the following QA/QC samples:

- MS/MSDs
- Matrix duplicate (metals)
- LCS/LCSDs
- Laboratory duplicate samples
- Serial dilution (metals)
- Field duplicate samples

Refer to Worksheet #12 (Method Performance Criteria Table) and Worksheet #28 (QC Samples Table) for QC samples analyzed and criteria limits.

3.1.1 February 2012

VOCs – VOCs precision QA/QC were acceptable.

SVOCs – SVOCs precision QA/QC were acceptable with the exception of the LCS/LCSD RPD for benzidine (27%), benzoic acid (116%), 2-nitroaniline (25%), and 4-nitrophenol (27%) were outside the acceptable limit and was qualified "UJ" as not detected, estimated quantitation limit in sample JP-M13-GWMWAEHA14R.

Explosives – Explosives precision QA/QC were acceptable.

TAL Metals – TAL metals precision QA/QC were acceptable with the exception of the serial dilution in sample M13LMWAEHA14R for potassium (12%). Potassium was qualified "J" as estimated in the following samples:

- JP-M13-GWMW126R
- JP-M13-GWMW362
- JP-M13-GWMW806
- JP-M13-GWMW807
- JP-M13-GWMW808
- JP-M13-GWMW809
- JP-M13-GWMW999

Sulfate – Sulfate precision QA/QC were acceptable.

Nitrate – Nitrate precision QA/QC were acceptable.

3.1.2 April 2012

VOCs – VOCs precision QA/QC were acceptable.

SVOCs – SVOCs precision QA/QC were acceptable with the exception of the MS/MSD (JP-M13-GWMW126R) RPD for n-nitrosodimethylamine (65%) and benzoic acid (32%). N-nitrosodimethylamine and benzoic acid were not detected in the subject sample, therefore, no qualifiers were added to the data.

The ICV %RSDs were outside the acceptable limit for the following compounds:

- N-nitrosodimethylamine (33.0%)
- 3&4-methylphenol (19.0%)
- dibenzofuran (17.0%)
- Di-n-butylphthalate (17.0%)
- Benzo(k)fluoranthene (22.0%)

If the above listed compound was detected in a sample listed below, it was qualified "J" as estimated.

- JP-M13-GWMW126R
- JP-M13-GWMW362
- JP-M13-GWMW806
- JP-M13-GWMW807
- JP-M13-GWMW808
- JP-M13-GWMW809
- JP-M13-GWMW999
- JP-M11-GWMW335
- JP-M11-GWMW802
- JP-M11-GWMW805

The ICV %RSDs associated with sample JP-M11-GWMW336 were outside the acceptable limit for the following compounds:

- Benzoic acid (55.0%)
- 2,4-dinitrophenol (19.0%)

If detected, the compound was qualified "J" as estimated.

Explosives – Explosives precision QA/QC were acceptable with the following exceptions discussed below.

The difference between detected results between parent sample JP-M13-GWMW362 and duplicate sample JP-M13-GWMW999 were greater than the acceptable limits for

2-nitrotoluene (1.76 micrograms per liter [ug/L]) and 4-nitrotoluene (1.59 ug/L). Detections of these compounds for these two samples were flagged as "J" for estimated.

TAL Metals – TAL metals precision QA/QC were acceptable.

Sulfate – Sulfate precision QA/QC were acceptable.

Nitrate – Nitrate precision QA/QC were acceptable.

3.2 ACCURACY

Accuracy was quantitatively evaluated by comparing the percent recovery (%R) or percent difference (%D) for the following QA/QC samples or parameters:

- Surrogate spikes (VOCs and SVOCs)
- Internal standards (VOCs and SVOCs)
- ICVs
- CCVs
- MS/MSDs
- LCSs
- ICSs (metals)

Refer to Worksheet #12 (Method Performance Criteria Table) and Worksheet #28 (QC Samples Table) for QC samples analyzed and criteria limits.

3.2.1 February 2012

VOCs – The CCV %D was outside the acceptable limit for 2-butanone (24.9%), trans-1,3-dichloropropene (22.5%), 2-hexanone (34.4%), hexachlorobutadiene (28.5%), and 1,2,3-trichlorobenzene (32.3%). These compounds were not detected and were qualified "UJ" as not detected, estimated quantitation limit in the following samples:

- JP-M13-GWMW126R
- JP-M13-GWMW362
- JP-M13-GWMW806
- JP-M13-GWMW807
- JP-M13-GWMW808
- JP-M13-GWMW809
- JP-M13-GWMW999
- Trip Blank

The CCV %D was outside the acceptable limit for dichlorodifluoromethane (25.8%), vinyl acetate (20.3%), cis-1,3-dichloropropene (27.3%), 4-methyl-2-pentanone (26.8%), 1,1,1-trichloroethane (32.9%), 1,1,2-trichloroethane (22.5%), 2-hexanone (29.6%), 1,2-dibromomethane (24.6%), 1,1,2,2-tetrachloroethane (21.9%), n-propylbenzene (23.5%), hexachlorobutadiene (30.6%), and 1,2,3-trichlorobenzene (32.5%). These

compounds were not detected and were qualified "UJ" as not detected, estimated quantitation limit in the following samples:

- JP-M13-GWAEHA14R
- JP-M13-GWAEHA15

The second source calibration standard %Ds were outside the acceptable limit for chloromethane (21.7%) and dichlorodifluoromethane (27.6%). These compounds were not detected and were qualified "UJ" as not detected, estimated quantitation limit in the following samples:

- JP-M13-GWMW126R
- JP-M13-GWMW362
- JP-M13-GWMW806
- JP-M13-GWMW807
- JP-M13-GWMW808
- JP-M13-GWMW809
- JP-M13-GWMW999
- Trip Blank
- JP-M13-GWAEHA14R
- JP-M13-GWAEHA15

The MS/MSD (JP-M13-GWMW808) %Rs were outside acceptable limits for the following compounds:

- Vinyl acetate (123% MS)
- 2-hexanone (131% MSD)
- 1,1,2-trichloroethane (131%, 129%)

These compounds were not detected and therefore qualification was not required..

The LCS %R for 1,1,2-trichloroethane (129%) was above the acceptable limit. This compound (1,1,2-trichloroethane) was not detected in the associated samples, therefore qualification was not necessary.

The LCS %R for vinyl acetate (125%) was above the acceptable limit. Vinyl acetate was not detected in associated samples and no qualifiers were added to the data.

SVOCs – The CCV %Ds were outside the acceptable limits for the following compounds:

- 4-chlorophenyl-phenyl ether (20.2%)
- 2,4-dimethylphenol (21.5%)
- 2-methylnaphthalene (23.4%)
- 2,4,6-trichlorophenol (22.2%)
- 2-chloronaphthalene (20.6%)
- Acenaphthene (20.5%)

- 2,4-dinitrophenol (25.8%)
- 4-nitrophenol (20.5%)
- Fluorine (22.1%)
- N-nitrosodiphenylamine (23.8%)
- Hexachlorobenzene (24.0%)
- Phenanthrene (21.9%)
- Anthracene (21.7%)
- Carbazole (20.5%)
- Benzo(a)anthracene (21.8%)

These compounds were not detected and therefore were qualified "UJ" as not detected, estimated quantitation limit, in the following samples:

- JP-M13-GWMW126R
- JP-M13-GWMW362
- JP-M13-GWMW806
- JP-M13-GWMW807
- JP-M13-GWMW808
- JP-M13-GWMW809
- JP-M13-GWMW999
- Trip Blank
- JP-M13-GWAEHA14R
- JP-M13-GWAEHA15

The ICV %D was outside the acceptable limit for 3&4-methylphenol (17.0%), benzoic acid (25.0%), fluorine (16.0%), butylbenzylphthalate (18.0%), bis(2-ethylhexyl)phthalate (20.0%), and benzo(k)fluoranthene (19.0%). None of these compounds were detected and were qualified "UJ" as not detected, estimated quantitation limit in the following samples:

- JP-M13-GWMW126R
- JP-M13-GWMW362
- JP-M13-GWMW806
- JP-M13-GWMW807
- JP-M13-GWMW808
- JP-M13-GWMW809
- JP-M13-GWMW999
- Trip Blank
- JP-M13-GWAEHA14R
- JP-M13-GWAEHA15

The second source calibration standard %Ds were outside the acceptable limit for bis(2-chloroethyl)ether (25.5%). This compound was not detected and was qualified "UJ" as not detected, estimated quantitation limit, in the following samples:

- JP-M13-GWAEHA14R
- JP-M13-GWAEHA15

The MS/MSD %Rs were outside the acceptable limits for the following compounds:

- Benzo(a)pyrene (116% MS, 120% MSD)
- Di-n-octylphthalate (141% MSD)

These compounds were not detected and were qualified "UJ" as not detected, estimated quantitation limit in the associated sample JP-M13-GWMW808.

The surrogate spike %R recoveries were all acceptable with the exception of 2-fluorophenol (3%), phenol-d5 (7%), nitrobenzene (5%), and 2-fluorophenol (38%) associated with SDG 500-44555-1 in sample JP-M13-GWAEHA14R. All detected compounds associated with these surrogates were qualified as R and non-detect results were flagged as "J" in the following associated samples. However, this sample were re-run and surrogate recoveries were acceptable. As a result, the re-run analyses were reported as estimated.

Internal standard areas and retention times were acceptable.

Explosives – Explosives accuracy QA/QC were acceptable with the following exceptions.

The MS/MSD %Rs were outside the acceptable limits for the following compounds:

- HMX (133% MS, 134% MSD)
- 1,3,5-Trinotrobenzene (142% MS)
- 4-Nitrotoluene (137% MS, 137% MSD)

These compounds, associated with sample JP-M13-GWMW808, were not detected and no qualifiers were necessary.

TAL Metals – TAL Metals accuracy QA/QC were acceptable

Sulfate – Sulfate accuracy QA/QC were acceptable

Nitrate – Nitrate accuracy QA/QC were acceptable.

3.2.2 April 2012

VOCs - The %Ds in the CCV were outside the acceptable limit for the following compounds:

- Isopropylbenzene (20.4%)

Isopropylbenzene was not detected and was qualified "UJ" as not detected, estimated quantitation limit, in the following samples:

- JP-M13-GWMW126R
- JP-M13-GWMW362
- JP-M13-GWMW806
- JP-M13-GWMW807
- JP-M13-GWMW808
- JP-M13-GWMW809
- JP-M13-GWMW999
- JP-M11-GWMW335
- JP-M11-GWMW336
- JP-M11-GWMW802
- JP-M11-GWMW805
- Trip Blanks

SVOCs - The %Ds in the CCV were outside the acceptable limit for the following compounds:

- 2-methylnaphthalene (20.3%)
- dibenzofuran (21.3%)
- Di-n-butylphthalate (20.5%)

The above compounds were not detected and were qualified "UJ" as not detected, estimated quantitation limit, in the following samples:

- JP-M13-GWMW126R
- JP-M13-GWMW362
- JP-M13-GWMW806
- JP-M13-GWMW807
- JP-M13-GWMW808
- JP-M13-GWMW809
- JP-M13-GWMW999

The %Ds in the CCV were outside the acceptable limit for the following compounds:

- N-nitrosodimethylamine (41.8%)
- Benzoic acid (44.4%)
- 2,4-dinitrophenol (32.5%)
- 4-nitrophenol (25.6%)

The above compounds were not detected and were qualified "UJ" as not detected, estimated quantitation limit, in the following samples:

- JP-M11-GWMW336

The second source calibration standard %Ds were outside the acceptable limit for 2-methylnaphthalene (20.3%), dibenzofuran (21.3%), and di-n-butylphthalate (20.5%). These compounds were not detected and were qualified "UJ" as not detected, estimated quantitation limit in the following samples:

- JP-M11-GWMW802
- JP-M11-GWMW805
- JP-M11-GWMW335

The second source calibration standard %Ds was outside the acceptable limit for benzoic acid (125.4%). This compound was not detected and was qualified "UJ" as not detected, estimated quantitation limit, in the following samples:

- JP-M11-GWMW336

Explosives – The CCV %D for n-nitrotoluene (17.5%) was outside the acceptable limits. When not detected, n-nitrotoluene was qualified "UJ" and "J" for detected results in the following samples associated with SDG 500-45457-1:

- JP-OA-GWMW118
- JP-OA-GWMW119
- JP-OA-GWMW117

The CCV %D for 2,4,6-trinitrotoluene (16.6%) was outside the acceptable limits. Non-detect sample results were qualified "UJ" and samples with detection were qualified "J" in the following sample associated with SDG 500-45518-1 and 500-45519-1:

- JP-M13-GWMW807
- JP-M06-GWMW654
- JP-M11-GWMW335
- JP-M11-GWMW336
- JP-M11-GWMW802
- JP-M11-GWMW805

The LCS %R for HMX (116%) was above the acceptable limit. HMX detections were flagged with "J" for the following samples were detected:

- JP-L1-GWMW173-0412
- JP-L1-GWMW174-0412
- JP-L1-GWMWWES3-0412
- JP-L3-GWMW410-0412
- JP-L3-GWMW412-0412
- JP-L3-GWMW630-0412
- JP-L3-GWMW631-0412
- JP-L3-GWMW633-0412
- JP-L3-GWMW999-0412
- JP-L3-SW557-0412
- JP-L3-SW558-0412
- JP-L3-SW777-0412
- JP-L1-GWMW131
- JP-L1-GWWES1

- JP-L1-SW550
- JP-OA-GWMW118
- JP-OA-GWMW119
- JP-OA-GWMW117
- JP-L3-SW004-0412

The %D between the duel columns for samples with detections were outside of the acceptance criteria for 4-amino-2.6-dinotrotoluene (47.9%) and 2-amino-4,6-dintrotoluene (53.3%) associated with sample JP-L3-GWMW630-0412, 4-amino-2.6-dinotrotoluene (61.7%) and 2-amino-4,6-dintrotoluene (58.1%) associated with sample JP-L3-GWMW999-0412, and 1,3,5-trinitrobenzene (51.3%) associated with sample JP-L3-GWMW412-0412 for SDG 500-45420-1.

The %D between the duel columns for samples with detections were outside of the acceptance criteria for 1.3-dinitrobenzene (130.0%) associated with sample JP-L1-GWMW131 and 4-amino-2.6-dinotrotoluene (63.5%) and 1,3,5-trinitrobenzene (189.8%) associated with sample JP-L1-GWWES1 for SDG 500-45457-1.

The %D between the duel columns for samples with detections was outside of the acceptance criteria for 2-nitrotoluene (79.0%) associated with sample JP-M13-GWMW362 for SDG 500-45518-1.

The %D between the duel columns for samples were outside of the acceptance criteria for RDX (182.3%) and 3-nitrotoluene (149.1%) associated with sample JP-M06-MWGW654 for SDG 500-45519-1.

The %D between the duel columns for samples were outside of the acceptance criteria for the following associated with SDG 500-45521-1:

- 2,4-dinitrotoluene (113.0%) associated with sample JP-M06-MWGW162R
- 4-amino-2.6-dinotrotoluene (61.5%) and 2-amino-4,6-dintrotoluene (60.2%) associated with sample JP-M06-MWGW212R
- 2,6-dinitrotoluene (146.1%) and 2,4-dinitrotoluene (176.1%) associated with sample JP-M06-MWGW318
- 2,4,6-trinitrotoluene (129.6%) associated with sample JP-M06-MWGW319
- 4-amino-2.6-dinotrotoluene (67.5%) associated with sample JP-M06-GWMW652
- 4-amino-2.6-dinotrotoluene (71.9%) and 4-nitrotoluene (57.2%) associated with sample JP-M06-GWMW994

All detections associated with these compounds and samples above were qualified with "J".

The surrogate spike %R recoveries were all acceptable with the exception of 1,2-dinitrobenzene (201%). All detected compounds associated with the following compounds were qualified as "J":

- JP-M06-GWMW318

TAL Metals – The MSD (JP-M13-GWMW126R) %R for magnesium (70%), sodium (76%), and mercury (77%) were less than the acceptable limits. These metals were qualified "J" as estimated for detections and UJ for non-detects in the following samples:

- JP-M13-GWMW126R
- JP-M13-GWMW362
- JP-M13-GWMW806
- JP-M13-GWMW807
- JP-M13-GWMW808
- JP-M13-GWMW809
- JP-M13-GWMW999

Sulfate - Sulfate accuracy QA/QC were acceptable.

Nitrate – Nitrate accuracy QA/QC were acceptable.

Accuracy was also quantitatively evaluated by reviewing concentrations of the following QA/QC samples:

- ICBs
- CCBs
- Method blanks
- Trip blanks

3.2.3 February 2012

VOCs – VOCs were not detected in associated blanks.

SVOCs – SVOCs were not detected in associated blanks.

Explosives – Explosives were not detected in associated blanks.

TAL Metals – The following metals were detected in method blanks, ICBs, or CCBs:

- antimony (0.00357 milligrams per liter [mg/L])
- barium (0.000520 mg/L and 0.0664 mg/L)
- lead (0.00175 mg/L and 0.0032 mg/L)

Antimony was qualified "U" as not detected at the reported concentration in the following samples:

- JP-M13-GWMW362 (0.0035 U)
- JP-M13-GWMW807 (0.0030 U)

- JP-M13-GWMW809 (0.0028 U)
- JP-M13-GWMW999 (0.0031 U)
- JP-M13-GWMW808 (0.0033 U)

Lead was qualified "U" as not detected at the reported concentration in the following samples:

- JP-M13-GWMW362 (0.0016 U)
- JP-M13-GWMW126R (0.0016 U)
- JP-M13-GWMW999 (0.0016 U)
- JP-M13-GWMW807 (0.0017 U)

Qualifiers were not added to the data for barium because either the sample concentration was greater than five times the blank concentration or the analyte was not detected.

Sulfate – Sulfate was detected in the following blanks:

- ICB/CCB (0.0976 mg/L)

Sulfate was not qualified based on blank contamination because all sample concentrations were greater than five times the blank concentration or sulfate was not detected.

Nitrate – Nitrate was not detected in associated blanks.

3.2.4 April 2012

VOCs – VOCs were not detected in associated blanks.

SVOCs – SVOCs were not detected in associated blanks.

Explosives – Explosives were not detected in associated blanks.

TAL Metals – The following metals were detected in method blanks, ICBs, or CCBs:

- copper (0.00549 mg/L)

Copper was qualified "U" as not detected at the reported concentration in the following samples:

- JP-L3-GWMW412-0412 (0.026U)
- JP-L3-GWMW630-0412 (0.027U)
- JP-L3-GWMW631-0412 (0.015U)
- JP-L3-GWMW633-0412 (0.023U)
- JP-L3-GWMW999-0412 (0.020U)
- JP-L3-SW557-0412 (0.023U)

- JP-L3-SW558-0412 (0.0066U)
- JP-L3-SW777-0412 (0.0041U)

The following metals were detected in method blanks, ICBs, or CCBs:

- copper (0.00557 mg/L)
- calcium (0.100 mg/L)
- zinc (0.00582 mg/L)

Copper was qualified "U" as not detected at the reported concentration in the following samples:

- JP-L3-SW004-0412 (0.018U)

Sulfate – Sulfate was not detected in associated blanks.

Nitrate – Nitrate was not detected in associated blanks.

3.3 REPRESENTATIVENESS

Representativeness was evaluated through a review of the following QA/QC elements:

- Sample preservation
- Sample holding times
- Compliance with sample collection, handling, and analysis methods specified in the Work Plan

Refer to QAPP Worksheets # 21 through # 27 for evaluation criteria related to representativeness.

3.3.1 February 2012

VOCs – Representativeness was acceptable.

SVOCs – Representativeness was acceptable. However, sample JP-M13-GWMWAEHA-14R was reanalyzed (original analysis reported low surrogate recovery) outside of the acceptable hold time. Detections were qualified with "J" and non-detects were qualified with UJ as a result.

Explosives – Representativeness was acceptable.

TAL Metals – Representativeness was acceptable.

Sulfate – Representativeness was acceptable.

Nitrate – Representativeness was acceptable.

3.3.2 April 2012

VOCs – Representativeness was acceptable.

SVOCs – Representativeness was acceptable.

Explosives – Representativeness was acceptable.

TAL Metals – Representativeness was acceptable.

Nitrate – Representativeness was acceptable. However samples JP-M13-GWMW999, JP-M13-GWMW809, JP-M13-GWMW806, and JP-M13-GWMW807 were reanalyzed outside of the acceptable hold time. Detections were qualified with "J" and non-detects were qualified with UJ.

Sulfate – Representativeness was acceptable.

3.4 COMPARABILITY

Comparability was qualitatively evaluated through a review of the following QA/QC elements:

- Sample collection and handling procedures
- Sample preparation, analysis, and quantitation procedures
- Units of measure

Refer to QAPP Worksheets # 21 through # 27 for evaluation criteria related to comparability.

Comparability was acceptable for the February and April 2012 sampling events.

3.5 COMPLETENESS

Completeness was calculated by dividing the number of acceptable sample results by the total number of scheduled sample results. The completeness goal for holding times was 100%. Completeness goals for holding times were met for all analytes in the April 2012 sampling round. The completeness goal for holding times for February 2012 samples was 97.7% since the SVOC results were re-run for sample JP-M13-GWAEHA14R outside of hold times.

The laboratory completeness goal for the number of acceptable sample results compared to the total sample results is 95%. Only results qualified "R" as unusable were considered unacceptable sample results for calculating laboratory completeness. Sample results qualified "J" as estimated, "U" as not detected, or "UJ" as not detected estimated quantitation limit were considered quantitative and acceptable.

No analytes were qualified "R" as unusable for the February and April 2012 sampling rounds with the exception of naphthalene due to the low biased surrogate recoveries for sample JP-M13-GWMWAEHA-14R (sampled March 1, 2012 associated with the February 2012 samples). However, this sample was reanalyzed and the re-run analyses resulted in no rejected results. Completeness was 100% for February 2012 and 100% for April 2012. Data usability was 100% for the February and April 2012 sampling rounds.

Refer to QAPP Worksheet #37 for the data usability criteria.

3.6 SENSITIVITY

Sensitivity was evaluated by comparing method reporting limits (MRLs) with appropriate criteria. In samples not requiring dilutions, adequate sensitivity was demonstrated with MRLs equal to or less than the associated criteria.

Refer to QAPP Worksheet #15 the Reference Limits and Evaluation Table for compound specific MRLs, method detection limits, and project action limits.

3.7 TRACEABILITY

Traceability was evaluated by reviewing field documentation, chain-of-custody documentation, and analytical reports. Each sample was found to be traceable from collection through analysis.

3.8 DATA QUALIFIERS

Refer to Tables 3.1 through 3.5 for summaries of groundwater and surface water data. Refer to Appendix B2 for data validation reports.

3.9 CONCLUSIONS

As discussed in section 3.5, completeness goals were met for the February and April 2012 analytical data. The data complies with contract requirements. The estimated data qualified "J" or "UJ" and blank qualified data qualified "U" which does not meet QA criteria are considered usable and do not negatively impact the project objectives. There were no biases or trends observed in this dataset.

ATTN: Mr. Gary Reside

April 11, 2012

SUBJECT: JOAAP-GW, Data Validation

Dear Mr. Reside,

Enclosed are the final validation reports for the fractions listed below. These SDGs were received on March 29, 2012. Attachment 1 is a summary of the samples that were reviewed for each analysis.

LDC Project # 27391:

SDG #	Fraction
500-44539-1	Volatiles, Semivolatiles, Dissolved Metals, Wet Chemistry,
500-44555-1	Explosives

The data validation was performed under EPA Level III guidelines. The analyses were validated using the following documents, as applicable to each method:

- Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan(QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. Rev. 0 July 2009
- U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1, April 2009
- USEPA, Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review, June 2008
- USEPA, Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review, January 2010
- EPA SW 846, Third Edition, Test Methods for Evaluating Solid Waste, update 1, July 1992; update IIA, August 1993; update II, September 1994; update IIB, January 1995; update III, December 1996; update IIIA, April 1998; IIIB, November 2004; Update IV, February 2007

Please feel free to contact us if you have any questions.

Sincerely,

Christina Rink
Project Manager

Introduction

This data review covers 10 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8260B for Volatiles.

This review follows the Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan (QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. (Rev. 0 July 2009), the U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1 (April 2009), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 15.0% for each individual compound and less than or equal to 30.0% for calibration check compounds (CCCs).

In the case where the laboratory used a calibration curve to evaluate the compounds, all coefficients of determination (r^2) were greater than or equal to 0.990.

Average relative response factors (RRF) for all compounds were within method and validation criteria.

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0% for all compounds with the following exceptions:

Date	Compound	%D	Associated Samples	Flag	A or P
3/12/12	2-Butanone trans-1,3-Dichloropropene 2-Hexanone Hexachlorobutadiene 1,2,3-Trichlorobenzene	24.9 22.5 34.4 28.5 32.3	All samples in SDG 500-44539-1	J (all detects) UJ (all non-detects)	A

The percent difference (%D) of the second source calibration standard were less than or equal to 20.0% for all compounds with the following exceptions:

Date	Compound	%D	Associated Samples	Flag	A or P
2/20/12	Dichlorodifluoromethane Chloromethane	27.6 21.7	All samples in SDG 500-44539-1	J (all detects) UJ (all non-detects) J (all detects) UJ (all non-detects)	A

All of the continuing calibration relative response factors (RRF) for were within method and validation criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No volatile contaminants were found in the method blanks.

Sample "TRIP BLANK" was identified as a trip blank. No volatile contaminants were found.

VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VII. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits with the following exceptions:

Spike ID (Associated Samples)	Compound	MS (%R) (Limits)	MSD (%R) (Limits)	RPD (Limits)	Flag	A or P
JP-M13-GWMW808MS/MSD (JP-M13-GWMW808)	Vinyl acetate 2-Hexanone 1,1,2-Trichloroethane	123 (45-121) - 131 (75-125)	123 (45-121) 131 (55-130) 129 (75-125)	- - -	J (all detects) J (all detects) J (all detects)	A

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits with the following exceptions:

LCS ID	Compound	%R (Limits)	Associated Samples	Flag	A or P
500-142990/5	1,1,2-Trichloroethane	129 (75-125)	All samples in SD 500-44539-1	J (all detects)	P

IX. Regional Quality Assurance and Quality Control

Not applicable.

X. Internal Standards

All internal standard areas and retention times were within QC limits.

XI. Target Compound Identifications

Raw data were not reviewed for this SDG.

XII. Compound Quantitation and RLs

Raw data were not reviewed for this SDG.

XIII. Tentatively Identified Compounds (TICs)

Raw data were not reviewed for this SDG.

XIV. System Performance

Raw data were not reviewed for this SDG.

XV. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XVI. Field Duplicates

Samples JP-M13-GWMW809 and JP-M13-GWMW999 were identified as field duplicates. No volatiles were detected in any of the samples.

JP-M13-GWMW806
JP-M13-GWMW807
JP-M13-GWMW809
JP-M13-GWMW999
JP-M13-GWMW808
JP-M13-GWMW808MS
JP-M13-GWMW808MSD

Introduction

This data review covers 9 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8270C for Semivolatiles.

This review follows the Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan (QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. (Rev. 0 July 2009), the U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1 (April 2009), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 15.0% for each individual compound and less than or equal to 30.0% for calibration check compounds (CCCs) with the following exceptions:

Date	Compound	%RSD	Associated Samples	Flag	A or P
3/15/12	3&4-Methylphenol Benzoic acid Fluorene Butylbenzylphthalate Bis(2-ethylhexyl)phthalate Benzo(k)fluoranthene	17.0 25.0 16.0 18.0 20.0 19.0	All samples in SDG 500-44539-1	J (all detects) UJ (all non-detects)	A

In the case where the laboratory used a calibration curve to evaluate the compounds, all coefficients of determination (r^2) were greater than or equal to 0.990 .

Average relative response factors (RRF) for all compounds were within method and validation criteria.

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0% for all compounds.

The percent differences (%D) of the second source calibration standard were less than or equal to 20.0% for all compounds with the following exceptions:

Date	Compound	%D	Associated Samples	Flag	A or P
3/15/12	4-Chlorophenyl-phenyl ether	20.2	All samples in SDG 500-44539-1	J (all detects) UJ (all non-detects)	A
	2,4-Dimethylphenol	21.5			
	2-Methylnaphthalene	23.4			
	2,4,6-Trichlorophenol	22.2			
	2-Chloronaphthalene	20.6			
	Acenaphthene	20.5			
	2,4-Dinitrophenol	25.8			
	4-Nitrophenol	20.5			
	Fluorene	22.1			
	N-Nitrosodiphenylamine	23.8			
	4-Bromophenyl-phenyl ether	21.3			
	Hexachlorobenzene	24.0			
	Phenanthrene	21.9			
	Anthracene	21.7			
	Carbazole	20.5			
	Benzo(a)anthracene	21.8			

All of the continuing calibration relative response factors (RRF) were within method and validation criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No semivolatile contaminants were found in the method blanks.

No field blanks were identified in this SDG.

VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VII. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits with the following exceptions:

Spike ID (Associated Samples)	Compound	MS (%R) (Limits)	MSD (%R) (Limits)	RPD (Limits)	Flag	A or P
JP-M13-GWMW808MS/MSD (JP-M13-GWMW808)	Benzo(a)pyrene	116 (55-110)	120 (55-110)	-	J (all detects)	A
	Di-n-octylphthalate	-	141 (35-135)	-	J (all detects)	

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

IX. Regional Quality Assurance and Quality Control

Not applicable.

X. Internal Standards

All internal standard areas and retention times were within QC limits.

XI. Target Compound Identifications

Raw data were not reviewed for this SDG.

XII. Compound Quantitation and RLs

Raw data were not reviewed for this SDG.

XIII. Tentatively Identified Compounds (TICs)

Raw data were not reviewed for this SDG.

XIV. System Performance

Raw data were not reviewed for this SDG.

XV. Overall Assessment

Data flags are summarized at the end of this report if data has been qualified.

XVI. Field Duplicates

Samples JP-M13-GWMW809 and JP-M13-GWMW999 were identified as field duplicates. No semivolatiles were detected in any of the samples.

METHOD: GC/MS BNA (EPA SW 846 Method 8270)

Please see qualifications below for all questions answered "N". Not applicable questions are identified as "N/A".

Y N N/A Did the laboratory conduct an acceptable 5 point calibration prior to sample analysis?

Y N N/A Were percent relative standard deviations (%RSD) and relative response factors (RRF) within method criteria for all CCC's and SPCC's?

Y N N/A Was a curve fit used for evaluation? If yes, what was the acceptance criteria used for evaluation?

Y N N/A Did the initial calibration meet the acceptance criteria?

Y N N/A Were all %RSDs and RRFs within the validation criteria of ≤30/15% %RSD and ≥0.05 RRF ?

#	Date	Standard ID	Compound	Finding %RSD (Limit: ≤30.0%/15%)	Finding RRF (Limit: ≥0.05)	Associated Samples	Qualifications

VALIDATION FINDINGS WORKSHEET
Matrix Spike/Matrix Spike Duplicates

Reviewer: BR
2nd Reviewer:

METHOD: GC/MS BNA (EPA SW 846 Method 8270)

Please see qualifications below for all questions answered "N". Not applicable questions are identified as "N/A".

(Y) N N/A Were a matrix spike (MS) and matrix spike duplicate (MSD) analyzed for each matrix in this SDG? If no, indicate which matrix does not have an associated MS/MSD. Soil / Water.

(Y) N N/A Was a MS/MSD analyzed every 20 samples of each matrix?

Y (N) N/A Were the MS/MSD percent recoveries (%R) and the relative percent differences (RPD) within the QC limits?

#	Date	MS/MSD ID	Compound	MS %R (Limits)	MSD %R (Limits)	RPD (Limits)	Associated Samples	Qualifications
		8/9	III	114 (55-110)	120 (55-110)	( )	7	J+ 1A
			FFF	( )	141 (35-135)	( )		J

JP-M13-GWMW808MSD
JP-M13-GWMW808DUP

Introduction

This data review covers 10 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Methods 6010B and 7470A for Dissolved Metals. The metals analyzed were Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Vanadium, and Zinc.

This review follows the Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan (QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. (Rev. 0 July 2009), the U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1 (April 2009), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. ICPMS Tune

ICP-MS was not utilized in this SDG.

III. Calibration

An initial calibration was performed.

The frequency and analysis criteria of the initial calibration verification (ICV) and continuing calibration verification (CCV) were met.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No dissolved metal contaminants were found in the initial, continuing and preparation blanks with the following exceptions:

Method Blank ID	Analyte	Maximum Concentration	Associated Samples
PB (prep blank)	Antimony Barium Lead	0.00357 mg/L 0.000520 mg/L 0.00175 mg/L	All samples in SDG 500-44539-1

Data qualification by the initial, continuing and preparation blanks (ICB/CCB/PBs) was based on the maximum contaminant concentration in the ICB/CCB/PBs in the analysis of each analyte. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated method blanks with the following exceptions:

Sample	Analyte	Reported Concentration	Modified Final Concentration
JP-M13-GWMW126R	Lead	0.0016 mg/L	0.0016U mg/L
JP-M13-GWMW362	Antimony Lead	0.0035 mg/L 0.0016 mg/L	0.0035U mg/L 0.0016U mg/L
JP-M13-GWMW807	Antimony Lead	0.0030 mg/L 0.0017 mg/L	0.0030U mg/L 0.0017U mg/L
JP-M13-GWMW809	Antimony	0.0028 mg/L	0.0028U mg/L

Sample	Analyte	Reported Concentration	Modified Final Concentration
JP-M13-GWMW999	Antimony Lead	0.0031 mg/L 0.0016 mg/L	0.0031U mg/L 0.0016U mg/L
JP-M13-GWMW808	Antimony	0.0033 mg/L	0.0033U mg/L

No field blanks were identified in this SDG.

V. ICP Interference Check Sample (ICS) Analysis

The frequency of analysis was met.

The criteria for analysis were met.

VI. Matrix Spike/(Matrix Spike) Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VII. Duplicate Sample Analysis

Duplicate (DUP) sample analyses were reviewed for each matrix as applicable. Results were within QC limits.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

IX. Internal Standards (ICP-MS)

ICP-MS was not utilized in this SDG.

X. Furnace Atomic Absorption QC

Graphite furnace atomic absorption was not utilized in this SDG.

XI. ICP Serial Dilution

ICP serial dilution analysis was performed by the laboratory. The analysis criteria were met with the following exceptions:

Diluted Sample	Analyte	%D (Limits)	Associated Samples	Flag	A or P
JP-M13-GWMW808	Potassium	12 (≤10)	All samples in SDG 500-44539-1	J (all detects) UJ (all non-detects)	A

XII. Sample Result Verification

Raw data were not reviewed for this SDG.

XIII. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XIV. Field Duplicates

Samples JP-M13-GWMW809 and JP-M13-GWMW999 were identified as field duplicates. No dissolved metals were detected in any of the samples with the following exceptions:

Analyte	Concentration (mg/L)		RPD (Limits)	Difference (Limits)	Flags	A or P
	JP-M13-GWMW809	JP-M13-GWMW999				
Antimony	0.0028	0.0031	-	0.0003 (≤0.040)	-	-
Barium	0.031	0.031	-	0 (≤0.020)	-	-
Calcium	41	40	2 (≤25)	-	-	-
Lead	0.0050U	0.0016	-	0.0034 (≤0.0100)	-	-
Magnesium	31	31	0 (≤25)	-	-	-
Manganese	0.0055	0.0059	7 (≤25)	-	-	-
Potassium	2.6	2.6	0 (≤25)	-	-	-
Sodium	19	19	0 (≤25)	-	-	-
Vanadium	0.0022	0.0024	-	0.0002 (≤0.0100)	-	-

Introduction

This data review covers 9 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 300.0 for Dissolved Nitrate as Nitrogen and Dissolved Sulfate.

This review follows the Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan (QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. (Rev. 0 July 2009), the U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1 (April 2009), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Initial Calibration

All criteria for the initial calibration were met.

III. Calibration Verification

Calibration verification frequency and analysis criteria were met.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No contaminant concentrations were found in the initial, continuing and preparation blanks with the following exceptions:

Method Blank ID	Analyte	Concentration	Associated Samples
ICB/CCB	Sulfate	0.0976 mg/L	JP-M13-GWMW362 JP-M13-GWMW807

Sample concentrations were compared to concentrations detected in the method blanks. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated method blanks.

No field blanks were identified in this SDG.

V. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VI. Duplicates

Duplicate (DUP) sample analyses were reviewed for each matrix as applicable.

VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

VIII. Sample Result Verification

Raw data were not reviewed for this SDG.

IX. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

X. Field Duplicates

Samples JP-M13-GWMW809 and JP-M13-GWMW999 were identified as field duplicates. No contaminant concentrations were detected in any of the samples with the following exceptions:

Analyte	Concentration (mg/L)		RPD (Limits)	Difference (Limits)	Flags	A or P
	JP-M13-GWMW809	JP-M13-GWMW999				
Sulfate	5.9	5.9	0 (≤25)	-	-	-

Introduction

This data review covers 9 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8330 for Explosives.

This review follows the Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan (QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. (Rev. 0 July 2009), the U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1 (April 2009), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Initial Calibration

Initial calibration of compounds was performed for the primary (quantitation) column and confirmation column as required by the method.

The percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

III. Continuing Calibration

Continuing calibration was performed at the required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 15.0% QC limits.

The percent differences (%D) of the second source calibration standard were less than or equal to 15.0% for all compounds.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No explosive contaminants were found in the method blanks.

No field blanks were identified in this SDG.

V. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VI. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits with the following exceptions:

Spike ID (Associated Samples)	Compound	MS (%R) (Limits)	MSD (%R) (Limits)	RPD (Limits)	Flag	A or P
JP-M13-GWMW808MS/MSD (JP-M13-GWMW808)	HMX 1,3,5-Trinitrobenzene 4-Nitrotoluene	133 (80-115) 142 (65-140) 137 (50-130)	134 (80-115) - 137 (50-130)	- - -	J (all detects) J (all detects) J (all detects)	A

VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

VIII. Target Compound Identification

Raw data were not reviewed for this SDG.

IX. Compound Quantitation and RLs

Raw data were not reviewed for this SDG.

X. System Performance

Raw data were not reviewed for this SDG.

XI. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XII. Field Duplicates

Samples JP-M13-GWMW809 and JP-M13-GWMW999 were identified as field duplicates. No explosives were detected in any of the samples.

Laboratory Data Consultants, Inc.
Data Validation Report

Project/Site Name: JOAAP-GW

Collection Date: March 1, 2012

LDC Report Date: April 5, 2012

Matrix: Water

Parameters: Volatiles

Validation Level: EPA Level III

Laboratory: TestAmerica, Inc.

Sample Delivery Group (SDG): 500-44555-1

Sample Identification

JP-M13-GWMWAEHA 15
JP-M13-GWMWAEHA 14R
Trip Blank

Introduction

This data review covers 3 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8260B for Volatiles.

This review follows the Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan (QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. (Rev. 0 July 2009), the U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1 (April 2009), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 15.0% for each individual compound and less than or equal to 30.0% for calibration check compounds (CCCs).

In the case where the laboratory used a calibration curve to evaluate the compounds, all coefficients of determination (r^2) were greater than or equal to 0.990.

Average relative response factors (RRF) for all compounds were within method and validation criteria.

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0% for all compounds with the following exceptions:

Date	Compound	%D	Associated Samples	Flag	A or P
3/14/12	Dichlorodifluoromethane	25.8	All samples in SDG 500-44555-1	J (all detects) UJ (all non-detects)	A
	Vinyl acetate	20.3			
	cis-1,3-Dichloropropene	27.3			
	4-Methyl-2-pentanone	26.8			
	1,1,1-Trichloroethane	32.9			
	1,1,2-Trichloroethane	22.5			
	2-Hexanone	29.6			
	1,2-Dibromoethane	24.6			
	1,1,2,2-Tetrachloroethane	21.9			
	n-Propylbenzene	23.5			
	Hexachlorobutadiene	30.6			
	1,2,3-Trichlorobenzene	32.5			

The percent difference (%D) of the second source calibration standard were less than or equal to 20.0% for all compounds with the following exceptions:

Date	Compound	%D	Associated Samples	Flag	A or P
2/20/12	Dichlorodifluoromethane Chloromethane	27.6 21.7	All samples in SDG 500-44555-1	J (all detects) UJ (all non-detects) J (all detects) UJ (all non-detects)	A

All of the continuing calibration relative response factors (RRF) for were within method and validation criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No volatile contaminants were found in the method blanks.

Sample "Trip Blank" was identified as a trip blank. No volatile contaminants were found.

VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VII. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits with the following exceptions:

LCS ID	Compound	%R (Limits)	Associated Samples	Flag	A or P
500-143093/4	Vinyl acetate	125 (45-121)	All samples in SD 500-44555-1	J (all detects)	P

IX. Regional Quality Assurance and Quality Control

Not applicable.

X. Internal Standards

All internal standard areas and retention times were within QC limits.

XI. Target Compound Identifications

Raw data were not reviewed for this SDG.

XII. Compound Quantitation and RLs

Raw data were not reviewed for this SDG.

XIII. Tentatively Identified Compounds (TICs)

Raw data were not reviewed for this SDG.

XIV. System Performance

Raw data were not reviewed for this SDG.

XV. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XVI. Field Duplicates

No field duplicates were identified in this SDG.

Laboratory Data Consultants, Inc.
Data Validation Report

Project/Site Name: JOAAP-GW

Collection Date: March 1, 2012

LDC Report Date: April 5, 2012

Matrix: Water

Parameters: Semivolatiles

Validation Level: EPA Level III

Laboratory: TestAmerica, Inc.

Sample Delivery Group (SDG): 500-44555-1

Sample Identification

JP-M13-GWMWAEHA 15
JP-M13-GWMWAEHA 14R
JP-M13-GWMWAEHA 14RRE

Introduction

This data review covers 3 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8270C for Semivolatiles.

This review follows the Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan (QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. (Rev. 0 July 2009), the U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1 (April 2009), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met with the following exceptions:

Sample	Compound	Total Days From Sample Collection Until Extraction	Required Holding Time (in Days) From Sample Collection Until Extraction	Flag	A or P
JP-M13-GWMWAEHA 14RRE	All TCL compounds	18	7	J (all detects) UJ (all non-detects)	A

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 15.0% for each individual compound and less than or equal to 30.0% for calibration check compounds (CCCs) with the following exceptions:

Date	Compound	%RSD	Associated Samples	Flag	A or P
3/15/12	3&4-Methylphenol Benzoic acid Fluorene Butylbenzylphthalate Bis(2-ethylhexyl)phthalate Benzo(k)fluoranthene	17.0 25.0 16.0 18.0 20.0 19.0	All samples in SDG 500-44555-1	J (all detects) UJ (all non-detects)	A

In the case where the laboratory used a calibration curve to evaluate the compounds, all coefficients of determination (r^2) were greater than or equal to 0.990 .

Average relative response factors (RRF) for all compounds were within method and validation criteria.

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0% for all compounds with the following exceptions:

Date	Compound	%D	Associated Samples	Flag	A or P
3/20/12	Bis(2-chloroethyl) ether	25.5	JP-M13-GWMWAEHA 14RRE 500-143645-MB	J (all detects) UJ (all non-detects)	A

The percent differences (%D) of the second source calibration standard were less than or equal to 20.0% for all compounds with the following exceptions:

Date	Compound	%D	Associated Samples	Flag	A or P
3/15/12	4-Chlorophenyl-phenyl ether	20.2	All samples in SDG 500-44555-1	J (all detects) UJ (all non-detects)	A
	2,4-Dimethylphenol	21.5			
	2-Methylnaphthalene	23.4			
	2,4,6-Trichlorophenol	22.2			
	2-Chloronaphthalene	20.6			
	Acenaphthene	20.5			
	2,4-Dinitrophenol	25.8			
	4-Nitrophenol	20.5			
	Fluorene	22.1			
	N-Nitrosodiphenylamine	23.8			
	4-Bromophenyl-phenyl ether	21.3			
	Hexachlorobenzene	24.0			
	Phenanthrene	21.9			
	Anthracene	21.7			
	Carbazole	20.5			
	Benzo(a)anthracene	21.8			

All of the continuing calibration relative response factors (RRF) were within method and validation criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No semivolatile contaminants were found in the method blanks.

No field blanks were identified in this SDG.

VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits with the following exceptions:

Sample	Surrogate	%R (Limits)	Compound	Flag	A or P
JP-M13-GWMWAEHA 14R	2-Fluorophenol Phenol-d5 Nitrobenzene-d5 2-Fluorobiphenyl	3 (20-110) 7 (10-115) 5 (40-110) 38 (50-110)	All TCL compounds	J (all detects) R (all non-detects)	A

VII. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits with the following exceptions:

LCS ID (Associated Samples)	Compound	LCS %R (Limits)	LCSD %R (Limits)	RPD (Limits)	Flag	A or P
500-143645/2-A (JP-M13-GWMWAEHA 14R 500-143645-MB)	Benzidine Benzoic acid 2-Nitroaniline 4-Nitrophenol	- - - -	- - - -	27 (≤20) 116 (≤20) 25 (≤20) 27 (≤20)	J (all detects) UJ (all non-detects)	P

IX. Regional Quality Assurance and Quality Control

Not applicable.

X. Internal Standards

All internal standard areas and retention times were within QC limits with the following exceptions:

Sample	Internal Standards	Area (Limits)	Compound	Flag	A or P
JP-M13-GWMWAEHA 14R	Chrysene-d12 Perylene-d12	276691 (284090-1136358) 218084 (342810-685619)`	Pyrene Butylbenzylphthalate 3,3'-Dichlorobenzidine Benzo(a)anthracene Chrysene Bis(2-ethylhexyl)phthalate Benzidine Di-n-octylphthalate Benzo(b)fluoranthene Benzo(k)fluoranthene Benzo(a)pyrene Indeno(1,2,3-cd)pyrene Dibenzo(a,h)anthracene Benzo(g,h,i)perylene	J (all detects) UJ (all non-detects)	A

XI. Target Compound Identifications

Raw data were not reviewed for this SDG.

XII. Compound Quantitation and RLs

Raw data were not reviewed for this SDG.

XIII. Tentatively Identified Compounds (TICs)

Raw data were not reviewed for this SDG.

XIV. System Performance

Raw data were not reviewed for this SDG.

XV. Overall Assessment

Data flags are summarized at the end of this report if data has been qualified.

XVI. Field Duplicates

No field duplicates were identified in this SDG.

Data Validation Report

Project/Site Name: JOAAP-GW

Collection Date: March 1, 2012

LDC Report Date: April 5, 2012

Matrix: Water

Parameters: Dissolved Metals

Validation Level: EPA Level III

Laboratory: TestAmerica, Inc.

Sample Delivery Group (SDG): 500-44555-1

Sample Identification

JP-M13-GWMWAEHA 15
JP-M13-GWMWAEHA 14R
JP-M13-GWMWAEHA 14RMS
JP-M13-GWMWAEHA 14RMSD
JP-M13-GWMWAEHA 14RDUP

Introduction

This data review covers 5 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Methods 6010B and 7470A for Dissolved Metals. The metals analyzed were Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Vanadium, and Zinc.

This review follows the Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan (QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. (Rev. 0 July 2009), the U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1 (April 2009), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. ICPMS Tune

ICP-MS was not utilized in this SDG.

III. Calibration

An initial calibration was performed.

The frequency and analysis criteria of the initial calibration verification (ICV) and continuing calibration verification (CCV) were met.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No dissolved metal contaminants were found in the initial, continuing and preparation blanks.

No field blanks were identified in this SDG.

V. ICP Interference Check Sample (ICS) Analysis

The frequency of analysis was met.

The criteria for analysis were met.

VI. Matrix Spike/(Matrix Spike) Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VII. Duplicate Sample Analysis

Duplicate (DUP) sample analyses were reviewed for each matrix as applicable. Results were within QC limits.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

IX. Internal Standards (ICP-MS)

ICP-MS was not utilized in this SDG.

X. Furnace Atomic Absorption QC

Graphite furnace atomic absorption was not utilized in this SDG.

XI. ICP Serial Dilution

ICP serial dilution analysis was performed by the laboratory. The analysis criteria were met.

XII. Sample Result Verification

Raw data were not reviewed for this SDG.

XIII. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XIV. Field Duplicates

No field duplicates were identified in this SDG.

Data Validation Report

Project/Site Name: JOAAP-GW

Collection Date: March 1, 2012

LDC Report Date: April 5, 2012

Matrix: Water

Parameters: Wet Chemistry

Validation Level: EPA Level III

Laboratory: TestAmerica, Inc.

Sample Delivery Group (SDG): 500-44555-1

Sample Identification

JP-M13-GWMWAEHA 15
JP-M13-GWMWAEHA 14R

Introduction

This data review covers 2 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 300.0 for Dissolved Nitrate as Nitrogen and Dissolved Sulfate.

This review follows the Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan (QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. (Rev. 0 July 2009), the U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1 (April 2009), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Initial Calibration

All criteria for the initial calibration were met.

III. Calibration Verification

Calibration verification frequency and analysis criteria were met.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No contaminant concentrations were found in the initial, continuing and preparation blanks.

No field blanks were identified in this SDG.

V. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VI. Duplicates

The laboratory has indicated that there were no duplicate (DUP) analyses specified for the samples in this SDG, and therefore duplicate analyses were not performed for this SDG.

VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

VIII. Sample Result Verification

Raw data were not reviewed for this SDG.

IX. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

X. Field Duplicates

No field duplicates were identified in this SDG.

Sample Identification

JP-M13-GWMWAEHA 15
JP-M13-GWMWAEHA 14R

Introduction

This data review covers 2 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8330 for Explosives.

This review follows the Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan (QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. (Rev. 0 July 2009), the U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1 (April 2009), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Initial Calibration

Initial calibration of compounds was performed for the primary (quantitation) column and confirmation column as required by the method.

The percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

III. Continuing Calibration

Continuing calibration was performed at the required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 15.0% QC limits.

The percent differences (%D) of the second source calibration standard were less than or equal to 15.0% for all compounds.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No explosive contaminants were found in the method blanks.

No field blanks were identified in this SDG.

V. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VI. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

VIII. Target Compound Identification

Raw data were not reviewed for this SDG.

IX. Compound Quantitation and RLs

Raw data were not reviewed for this SDG.

X. System Performance

Raw data were not reviewed for this SDG.

XI. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XII. Field Duplicates

No field duplicates were identified in this SDG.

LDC #: 27391B40 **VALIDATION COMPLETENESS WORKSHEET** Date: 4/03/12
SDG #: 500-44555-1 Level III Page: 1 of 1
Laboratory: Test America, Inc. Reviewer: ~~AA~~
2nd Reviewer: JV6

METHOD: HPLC Explosives (EPA SW 846 Method 8330)

The samples listed below were reviewed for each of the following validation areas. Validation findings are noted in attached validation findings worksheets.

	Validation Area		Comments
I.	Technical holding times	A	Sampling dates: 3/01/12
II	Initial calibration	A	%RSD ≤ 20%.
III.	Calibration verification/ICV	A	%D ≤ 15%.
IV.	Blanks	A	
V	Surrogate recovery	A	
VI.	Matrix spike/Matrix spike duplicates	N	
VII.	Laboratory control samples	A ~~A SW~~ AA analyte	LCS ONLY
VIII.	Target compound identification	N	
IX.	Compound quantitation/RL/LOQ/LODs	N	
X.	System Performance	N	
XI.	Overall assessment of data	A	
XII.	Field duplicates	N	
XIII.	Field blanks	N	

Note: A = Acceptable
N = Not provided/applicable
SW = See worksheet
ND = No compounds detected
R = Rinsate
FB = Field blank
D = Duplicate
TB = Trip blank
EB = Equipment blank

ATTN: Mr. Gary Reside

May 23, 2012

SUBJECT: JOAAP-GW, Data Validation

Dear Mr. Reside,

Enclosed is the final validation report for the fractions listed below. This SDG was received on May 7, 2012. Attachment 1 is a summary of the samples that were reviewed for each analysis.

LDC Project # 27595:

SDG #	Fraction
500-45420-1	Dissolved Metals, Explosives

The data validation was performed under EPA Level III guidelines. The analyses were validated using the following documents, as applicable to each method:

- Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan(QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. Rev. 0 July 2009
- U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1, April 2009
- USEPA, Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review, June 2008
- USEPA, Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review, January 2010
- EPA SW 846, Third Edition, Test Methods for Evaluating Solid Waste, update 1, July 1992; update IIA, August 1993; update II, September 1994; update IIB, January 1995; update III, December 1996; update IIIA, April 1998; IIIB, November 2004; Update IV, February 2007

Please feel free to contact us if you have any questions.

Sincerely,

Christina Rink
Project Manager/Chemist

Introduction

This data review covers 8 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Methods 6010B and 7470A for Dissolved Metals. The metals analyzed were Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Vanadium, and Zinc.

This review follows the Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan (QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. (Rev. 0 July 2009), the U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1 (April 2009), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. ICPMS Tune

ICP-MS was not utilized in this SDG.

III. Calibration

An initial calibration was performed.

The frequency and analysis criteria of the initial calibration verification (ICV) and continuing calibration verification (CCV) were met.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No dissolved metal contaminants were found in the initial, continuing and preparation blanks with the following exceptions:

Method Blank ID	Analyte	Maximum Concentration	Associated Samples
PB (prep blank)	Copper	0.00549 mg/L	All samples in SDG 500-45420-1

Data qualification by the initial, continuing and preparation blanks (ICB/CCB/PBs) was based on the maximum contaminant concentration in the ICB/CCB/PBs in the analysis of each analyte. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated method blanks with the following exceptions:

Sample	Analyte	Reported Concentration	Modified Final Concentration
JP-L3-SW557-0412	Copper	0.023 mg/L	0.023U mg/L
JP-L3-SW558-0412	Copper	0.0066 mg/L	0.0066U mg/L
JP-L3-GWMW631-0412	Copper	0.015 mg/L	0.015U mg/L
JP-L3-GWMW630-0412	Copper	0.027 mg/L	0.027U mg/L
JP-L3-GWMW999-0412	Copper	0.020 mg/L	0.020U mg/L

Sample	Analyte	Reported Concentration	Modified Final Concentration
JP-L3-GWMW412-0412	Copper	0.026 mg/L	0.026U mg/L
JP-L3-GWMW633-0412	Copper	0.023 mg/L	0.023U mg/L
JP-L3-SW777-0412	Copper	0.0041 mg/L	0.0041U mg/L

No field blanks were identified in this SDG.

V. ICP Interference Check Sample (ICS) Analysis

The frequency of analysis was met.

The criteria for analysis were met.

VI. Matrix Spike/(Matrix Spike) Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VII. Duplicate Sample Analysis

The laboratory has indicated that there were no duplicate (DUP) analyses specified for the samples in this SDG, and therefore duplicate analyses were not performed for this SDG.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

IX. Internal Standards (ICP-MS)

ICP-MS was not utilized in this SDG.

X. Furnace Atomic Absorption QC

Graphite furnace atomic absorption was not utilized in this SDG.

XI. ICP Serial Dilution

ICP serial dilution analysis was not performed by the laboratory.

XII. Sample Result Verification

Raw data were not reviewed for this SDG.

XIII. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XIV. Field Duplicates

Samples JP-L3-GWMW630-0412 and JP-L3-GWMW999-0412 were identified as field duplicates. No metals were detected in any of the samples with the following exceptions:

Analyte	Concentration (mg/L)		RPD (Limits)	Difference (Limits)	Flags	A or P
	JP-L3-GWMW630-0412	JP-L3-GWMW999-0412				
Barium	0.011	0.011	-	0 (≤0.020)	-	-
Cadmium	0.00078	0.00087	-	0.00009 (≤0.040)	-	-
Calcium	83	84	1 (≤25)	-	-	-
Copper	0.027	0.020	-	0.007 (≤0.020)	-	-
Magnesium	43	44	2 (≤25)	-	-	-
Manganese	0.033	0.032	-	0.001 (≤0.020)	-	-
Potassium	4.4	4.4	0 (≤25)	-	-	-
Sodium	22	22	0 (≤25)	-	-	-
Zinc	0.0087	0.020U	-	0.0113 (≤0.040)	-	-

Laboratory: Test America, Inc. gmM. Reviewer: MG
2nd Reviewer:

METHOD: Dissolved Metals (EPA SW 846 Method 6010B/~~7000~~) 7470A

The samples listed below were reviewed for each of the following validation areas. Validation findings are noted in attached validation findings worksheets.

	Validation Area		Comments
I.	Technical holding times	A	Sampling dates: 4-10-12 through 4-11-12
II.	ICP/MS Tune	N	not utilized
III.	Calibration	A	
IV.	Blanks	SW	
V.	ICP Interference Check Sample (ICS) Analysis	A	
VI.	Matrix Spike Analysis	N	client specified
VII.	Duplicate Sample Analysis	N	" "
VIII.	Laboratory Control Samples (LCS)	A	LCS
IX.	Internal Standard (ICP-MS)	N	not utilized
X.	Furnace Atomic Absorption QC	N	" "
XI.	ICP Serial Dilution	N	not performed
XII.	Sample Result Verification	N	
XIII.	Overall Assessment of Data	A	
XIV.	Field Duplicates	SW	D = 4+5
XV	Field Blanks	N	

Note: A = Acceptable; N = Not provided/applicable; SW = See worksheet; ND = No compounds detected; R = Rinsate; FB = Field blank; D = Duplicate; TB = Trip blank; EB = Equipment blank

METHOD: Trace metals (EPA SW 864 Method 6010B/6020/7000)
Sample Concentration units, unless otherwise noted: mg/L

VALIDATION FINDINGS WORKSHEET
PB/ICB/CCB QUALIFIED SAMPLES
Soil preparation factor applied: NA
Associated Samples: all

Reviewer: MG
2nd Reviewer:

Analyte	Maximum PB[a] (mg/Kg)	Maximum PB[a] (mg/L)	Maximum ICB/CCB[a] (ug/L)	Action Limit	1	2	3	4	5	6	7	8		
Cu		0.00549		0.02745	0.023	0.0066	0.015	0.027	0.020	0.026	0.023	0.0041		

Samples with analyte concentrations within five times the associated ICB, CCB or PB concentration are listed above with the identifications from the Validation Completeness Worksheet. These sample results were qualified as not detected, "U".
Note : a - The listed analyte concentration is the highest ICB, CCB, or PB detected in the analysis of each element.

Introduction

This data review covers 12 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8330 for Explosives.

This review follows the Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan (QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. (Rev. 0 July 2009), the U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1 (April 2009), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Initial Calibration

Initial calibration of compounds was performed for the primary (quantitation) column and confirmation column as required by the method.

The percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

III. Continuing Calibration

Continuing calibration was performed at the required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 15.0% QC limits.

The percent differences (%D) of the second source calibration standard were less than or equal to 15.0% for all compounds.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No explosive contaminants were found in the method blanks.

No field blanks were identified in this SDG.

V. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. Surrogate recoveries (%R) were not within QC limits for sample 23173-SB-022W. Since the sample was diluted out, no data were qualified.

VI. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits with the following exceptions:

LCS ID (Associated Samples)	Compound	LCS %R (Limits)	LCSD %R (Limits)	RPD (Limits)	Flag	A or P
LCS/D500-146630/2-A (All samples in SDG 500-45420-1)	HMX	116 (80-115)	121 (80-115)	-	J (all detects)	P

VIII. Target Compound Identification

Raw data were not reviewed for this SDG.

IX. Compound Quantitation and RLs

The sample results for detected compounds from the two columns were within 40% difference with the following exceptions:

Sample	Compound	%D	Flag	A or P
JP-L3-GWMW630-0412	4-Amino-2,6-dinitrotoluene 2-Amino-4,6-dinitrotoluene	47.9 53.3	J (all detects) J (all detects)	A
JP-L3-GWMW999-0412	4-Amino-2,6-dinitrotoluene 2-Amino-4,6-dinitrotoluene	61.7 58.1	J (all detects) J (all detects)	A
JP-L3-GWMW412-0412	1,3,5-Trinitrobenzene	51.3	J (all detects)	A

Raw data were not reviewed for this SDG.

X. System Performance

Raw data were not reviewed for this SDG.

XI. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XII. Field Duplicates

Samples JP-L3-GWMW630-0412 and JP-L3-GWMW999-0412 were identified as field duplicates. No explosives were detected in any of the samples with the following exceptions:

Compound	Concentration (ug/L)		RPD (Limits)	Difference (Limits)	Flags	A or P
	JP-L3-GWMW630-0412	JP-L3-GWMW999-0412				
HMX	4.7	4.7	0 (≤25)	-	-	-
2-Amino-4,6-dinitrotoluene	0.077	0.072	-	0.005 (≤0.31)	-	-
4-Amino-2,6-dinitrotoluene	0.18	0.15	-	0.03 (≤0.31)	-	-
RDX	8.7	8.7	0 (≤25)	-	-	-

ATTN: Mr. Gary Reside

May 24, 2012

SUBJECT: JOAAP-GW, Data Validation

Dear Mr. Reside,

Enclosed is the final validation report for the fractions listed below. This SDG was received on May 9, 2012. Attachment 1 is a summary of the samples that were reviewed for each analysis.

LDC Project # 27605:

SDG #	Fraction
500-45457-1	Dissolved Metals, Dissolved Sulfate, Explosives

The data validation was performed under EPA Level III guidelines. The analyses were validated using the following documents, as applicable to each method:

- Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan(QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. Rev. 0 July 2009
- U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1, April 2009
- USEPA, Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review, June 2008
- USEPA, Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review, January 2010
- EPA SW 846, Third Edition, Test Methods for Evaluating Solid Waste, update 1, July 1992; update IIA, August 1993; update II, September 1994; update IIB, January 1995; update III, December 1996; update IIIA, April 1998; IIIB, November 2004; Update IV, February 2007

Please feel free to contact us if you have any questions.

Sincerely,

Christina Rink
Project Manager/Chemist

JP-L3-SW004-0412DUP

Introduction

This data review covers 4 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Methods 6010B and 7470A for Dissolved Metals. The metals analyzed were Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Vanadium, and Zinc.

This review follows the Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan (QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. (Rev. 0 July 2009), the U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1 (April 2009), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. ICPMS Tune

ICP-MS was not utilized in this SDG.

III. Calibration

An initial calibration was performed.

The frequency and analysis criteria of the initial calibration verification (ICV) and continuing calibration verification (CCV) were met.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No dissolved metal contaminants were found in the initial, continuing and preparation blanks with the following exceptions:

Method Blank ID	Analyte	Maximum Concentration	Associated Samples
PB (prep blank)	Calcium Copper Zinc	0.100 mg/L 0.00556 mg/L 0.00582 mg/L	All samples in SDG 500-45457-1

Data qualification by the initial, continuing and preparation blanks (ICB/CCB/PBs) was based on the maximum contaminant concentration in the ICB/CCB/PBs in the analysis of each analyte. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated method blanks with the following exceptions:

Sample	Analyte	Reported Concentration	Modified Final Concentration
JP-L3-SW004-0412	Copper	0.018 mg/L	0.018U mg/L

No field blanks were identified in this SDG.

V. ICP Interference Check Sample (ICS) Analysis

The frequency of analysis was met.

The criteria for analysis were met.

VI. Matrix Spike/(Matrix Spike) Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VII. Duplicate Sample Analysis

Duplicate (DUP) sample analyses were reviewed for each matrix as applicable. Results were within QC limits.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

IX. Internal Standards (ICP-MS)

ICP-MS was not utilized in this SDG.

X. Furnace Atomic Absorption QC

Graphite furnace atomic absorption was not utilized in this SDG.

XI. ICP Serial Dilution

ICP serial dilution analysis was not performed by the laboratory.

XII. Sample Result Verification

Raw data were not reviewed for this SDG.

XIII. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XIV. Field Duplicates

No field duplicates were identified in this SDG.

Introduction

This data review covers 16 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 300.0 for Dissolved Sulfate.

This review follows the Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan (QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. (Rev. 0 July 2009), the U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1 (April 2009), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Initial Calibration

All criteria for the initial calibration were met.

III. Calibration Verification

Calibration verification frequency and analysis criteria were met.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No contaminant concentrations were found in the initial, continuing and preparation blanks.

No field blanks were identified in this SDG.

V. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VI. Duplicates

Duplicate (DUP) sample analyses were reviewed for each matrix as applicable.

VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

VIII. Sample Result Verification

Raw data were not reviewed for this SDG.

IX. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

X. Field Duplicates

Samples JP-M1-GWMW998-0412 and JP-M1-GWMW641-0412 and samples JP-M1-GWMW997-0412 and JP-M1-GWMW642-0412 were identified as field duplicates. No contaminant concentrations were detected in any of the samples with the following exceptions:

Analyte	Concentration (mg/L)		RPD (Limits)	Difference (Limits)	Flags	A or P
	JP-M1-GWMW998-0412	JP-M1-GWMW641-0412				
Sulfate	640	640	0 (≤25)	-	-	-

Laboratory Data Consultants, Inc.
Data Validation Report

Project/Site Name: JOAAP-GW

Collection Date: April 12 through April 13, 2012

LDC Report Date: May 22, 2012

Matrix: Water

Parameters: Explosives

Validation Level: EPA Level III

Laboratory: TestAmerica, Inc.

Sample Delivery Group (SDG): 500-45457-1

Sample Identification

JP-L3-SW004-0412
JP-L1-GWMW131
JP-L1-GWWES1
JP-L1-SW550
JP-OA-GWMW118
JP-OA-GWMW119
JP-OA-GWMW117

Introduction

This data review covers 7 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8330 for Explosives.

This review follows the Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan (QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. (Rev. 0 July 2009), the U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1 (April 2009), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Initial Calibration

Initial calibration of compounds was performed for the primary (quantitation) column and confirmation column as required by the method.

The percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

III. Continuing Calibration

Continuing calibration was performed at the required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 15.0% QC limits with the following exceptions:

Date	Column	Compound	%D	Associated Samples	Flag	A or P
4/18/12	UC5 ODS	2-Nitrotoluene	17.5	JP-OA-GWMW118 JP-OA-GWMW119 JP-OA-GWMW117	J (all detects) UJ (all non-detects)	A

The percent differences (%D) of the second source calibration standard were less than or equal to 15.0% for all compounds.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No explosive contaminants were found in the method blanks.

No field blanks were identified in this SDG.

V. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. Surrogate recoveries (%R) were not within QC limits for sample JP-L1-GWMW131. Since the sample was diluted out, no data were qualified.

VI. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits with the following exceptions:

LCS ID (Associated Samples)	Compound	LCS %R (Limits)	LCSD %R (Limits)	RPD (Limits)	Flag	A or P
LSC/D500-146630/2-A (All samples in SDG 500-45457-1)	HMX	116 (80-115)	121 (80-115)	-	J (all detects)	P

VIII. Target Compound Identification

Raw data were not reviewed for this SDG.

IX. Compound Quantitation and RLs

The sample results for detected compounds from the two columns were within 40% difference with the following exceptions:

Sample	Compound	%D	Flag	A or P
JP-L1-GWMW131	1,3-Dinitrobenzene	130.0	J (all detects)	A
JP-L1-GWWES1	1,3,5-Trinitrobenzene 4-Amino-2,6-dinitrotoluene	189.8 63.5	J (all detects) J (all detects)	A

Raw data were not reviewed for this SDG.

X. System Performance

Raw data were not reviewed for this SDG.

XI. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XII. Field Duplicates

No field duplicates were identified in this SDG.

ATTN: Mr. Gary Reside

May 31, 2012

SUBJECT: JOAAP-GW, Data Validation

Dear Mr. Reside,

Enclosed are the final validation reports for the fractions listed below. These SDGs were received on May 15, 2012. Attachment 1 is a summary of the samples that were reviewed for each analysis.

LDC Project # 27649:

SDG #	Fraction
500-45518-1 500-45519-1 500-45521-1	Volatiles, Semivolatiles, Dissolved Metals, Wet Chemistry, Explosives

The data validation was performed under EPA Level III guidelines. The analyses were validated using the following documents, as applicable to each method:

- Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan(QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. Rev. 0 July 2009
- U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1, April 2009
- USEPA, Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review, June 2008
- USEPA, Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review, January 2010
- EPA SW 846, Third Edition, Test Methods for Evaluating Solid Waste, update 1, July 1992; update IIA, August 1993; update II, September 1994; update IIB, January 1995; update III, December 1996; update IIIA, April 1998; IIIB, November 2004; Update IV, February 2007

Please feel free to contact us if you have any questions.

Sincerely,

Christina Rink
Project Manager/Chemist

Introduction

This data review covers 9 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8260B for Volatiles.

This review follows the Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan (QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. (Rev. 0 July 2009), the U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1 (April 2009), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 15.0% for each individual compound and less than or equal to 30.0% for calibration check compounds (CCCs).

Average relative response factors (RRF) for all compounds were within method and validation criteria.

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0% for all compounds.

The percent difference (%D) of the second source calibration standard were less than or equal to 20.0% for all compounds with the following exceptions:

Date	Compound	%D	Associated Samples	Flag	A or P
4/20/12	Isopropylbenzene	20.4	All samples in SDG 500-45518-1	J (all detects) UJ (all non-detects)	A

All of the continuing calibration relative response factors (RRF) for were within method and validation criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No volatile contaminants were found in the method blanks.

No field blanks were identified in this SDG.

VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VII. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

IX. Regional Quality Assurance and Quality Control

Not applicable.

X. Internal Standards

All internal standard areas and retention times were within QC limits.

XI. Target Compound Identifications

Raw data were not reviewed for this SDG.

XII. Compound Quantitation and RLs

Raw data were not reviewed for this SDG.

XIII. Tentatively Identified Compounds (TICs)

Raw data were not reviewed for this SDG.

XIV. System Performance

Raw data were not reviewed for this SDG.

XV. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XVI. Field Duplicates

Samples JP-M13-GWMW362 and JP-M13-GWMW999 were identified as field duplicates. No volatiles were detected in any of the samples.

JOAAP-GW
Volatiles - Data Qualification Summary - SDG 500-45518-1

SDG	Sample	Compound	Flag	A or P	Reason
500-45518-1	JP-M13-GWMW808 JP-M13-GWMW126R JP-M13-GWMW362 JP-M13-GWMW999 JP-M13-GWMW809 JP-M13-GWMW806 JP-M13-GWMW807	Isopropylbenzene	J (all detects) UJ (all non-detects)	A	Continuing calibration (ICV %D)

LDC #: 27649A1 **VALIDATION COMPLETENESS WORKSHEET** Date: 5/24/12
SDG #: 500-45518-1 Level III Page: 1 of 1
Laboratory: Test America, Inc. Reviewer: R
2nd Reviewer: CR

METHOD: GC/MS Volatiles (EPA SW 846 Method 8260B)

The samples listed below were reviewed for each of the following validation areas. Validation findings are noted in attached validation findings worksheets.

	Validation Area		Comments
I.	Technical holding times	A	Sampling dates: 4/16/12
II.	GC/MS Instrument performance check	A	
III.	Initial calibration	A	%RSD ≤ 30/15
IV.	Continuing calibration/ICV	SW	ccv/icv ≤ 20
V.	Blanks	A	
VI.	Surrogate spikes	A	
VII.	Matrix spike/Matrix spike duplicates	A	
VIII.	Laboratory control samples	A	LCS
IX.	Regional Quality Assurance and Quality Control	N	
X.	Internal standards	A	
XI.	Target compound identification	N	
XII.	Compound quantitation/RL/LOQ/LODs	N	
XIII.	Tentatively identified compounds (TICs)	N	
XIV.	System performance	N	
XV.	Overall assessment of data	A	
XVI.	Field duplicates	ND	D = 3+4
XVII.	Field blanks	N	

Note: A = Acceptable
N = Not provided/applicable
SW = See worksheet
ND = No compounds detected
R = Rinsate
FB = Field blank
D = Duplicate
TB = Trip blank
EB = Equipment blank

Introduction

This data review covers 9 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8270C for Semivolatiles.

This review follows the Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan (QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. (Rev. 0 July 2009), the U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1 (April 2009), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals with the following exceptions:

Sample	Compound	Total Time From DFTPP Tuning Until Analysis	Required Analysis Time (in Hours) From DFTPP Tuning Until Analysis	Flag	A or P
JP-M13-GWMW126RMS	All TCL compounds	12 hrs. 25 min.	12 hrs.	None	P
JP-M13-GWMW126RMSD	All TCL compounds	12 hrs. 47 min.	12 hrs.	None	P

All ion abundance requirements were met.

III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 15.0% for each individual compound and less than or equal to 30.0% for calibration check compounds (CCCs) with the following exceptions:

Date	Compound	%RSD	Associated Samples	Flag	A or P
5/1/12	N-Nitrosodimethylamine	33.0	All samples in SDG 500-45518-1	J (all detects)	A
	3&4-Methylphenol	19.0		J (all detects)	
	Dibenzofuran	17.0		J (all detects)	
	Di-n-butylphthalate	17.0		J (all detects)	
	Benzo(k)fluoranthene	22.0		J (all detects)	

In the case where the laboratory used a calibration curve to evaluate the compounds, all coefficients of determination (r^2) were greater than or equal to 0.990 .

Average relative response factors (RRF) for all compounds were within method and validation criteria.

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0% for all compounds.

The percent differences (%D) of the second source calibration standard were less than or equal to 20.0% for all compounds with the following exceptions:

Date	Compound	%D	Associated Samples	Flag	A or P
5/1/12	2-Methylnaphthalene Dibenzofuran Di-n-butylphthalate	20.3 21.3 20.5	All samples in SDG 500-45518-1	J (all detects) UJ (all non-detects)	A

All of the continuing calibration relative response factors (RRF) were within method and validation criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No semivolatile contaminants were found in the method blanks.

No field blanks were identified in this SDG.

VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VII. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits with the following exceptions:

Spike ID (Associated Samples)	Compound	MS (%R) (Limits)	MSD (%R) (Limits)	RPD (Limits)	Flag	A or P
JP-M13-GWMW126RMS/MSD (JP-M13-GWMW126R)	N-Nitrosodimethylamine Benzoic acid	- -	- -	65 (≤30) 32 (≤30)	J (all detects) J (all detects)	A

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

IX. Regional Quality Assurance and Quality Control

Not applicable.

X. Internal Standards

All internal standard areas and retention times were within QC limits.

XI. Target Compound Identifications

Raw data were not reviewed for this SDG.

XII. Compound Quantitation and RLs

Raw data were not reviewed for this SDG.

XIII. Tentatively Identified Compounds (TICs)

Raw data were not reviewed for this SDG.

XIV. System Performance

Raw data were not reviewed for this SDG.

XV. Overall Assessment

Data flags are summarized at the end of this report if data has been qualified.

XVI. Field Duplicates

Samples JP-M13-GWMW362 and JP-M13-GWMW999 were identified as field duplicates. No semivolatiles were detected in any of the samples with the following exceptions:

Compound	Concentration (ug/L)		RPD (Limits)	Difference (Limits)	Flags	A or P
	JP-M13-GWMW362	JP-M13-GWMW999				
2,4-Dinitrotoluene	3.3	2.6	-	0.7 (≤1.3)	-	-
2,6-Dinitrotoluene	0.25	0.29	-	0.04 (≤0.47)	-	-

Introduction

This data review covers 10 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Methods 6010B and 7470A for Dissolved Metals. The metals analyzed were Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Nickel, Potassium, Selenium, Sodium, Thallium, Vanadium, and Zinc.

This review follows the Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan (QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. (Rev. 0 July 2009), the U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1 (April 2009), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. ICPMS Tune

ICP-MS was not utilized in this SDG.

III. Calibration

An initial calibration was performed.

The frequency and analysis criteria of the initial calibration verification (ICV) and continuing calibration verification (CCV) were met.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No dissolved metal contaminants were found in the initial, continuing and preparation blanks.

No field blanks were identified in this SDG.

V. ICP Interference Check Sample (ICS) Analysis

The frequency of analysis was met.

The criteria for analysis were met.

VI. Matrix Spike/(Matrix Spike) Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits with the following exceptions:

Spike ID (Associated Samples)	Analyte	MS (%R) (Limits)	MSD (%R) (Limits)	RPD (Limits)	Flag	A or P
JP-M13-GWMW126RMS/MSD (All samples in SDG 500-45518-1)	Magnesium Sodium Mercury	-	70 (80-120) 76 (80-120) 77 (80-120)	-	J (all detects) UJ (all non-detects)	A

VII. Duplicate Sample Analysis

Duplicate (DUP) sample analyses were reviewed for each matrix as applicable.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

IX. Internal Standards (ICP-MS)

ICP-MS was not utilized in this SDG.

X. Furnace Atomic Absorption QC

Graphite furnace atomic absorption was not utilized in this SDG.

XI. ICP Serial Dilution

ICP serial dilution analysis was performed by the laboratory. The analysis criteria were met.

XII. Sample Result Verification

Raw data were not reviewed for this SDG.

XIII. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XIV. Field Duplicates

Samples JP-M13-GWMW362 and JP-M13-GWMW999 were identified as field duplicates. No metals were detected in any of the samples with the following exceptions:

Analyte	Concentration (mg/L)		RPD (Limits)	Difference (Limits)	Flags	A or P
	JP-M13-GWMW362	JP-M13-GWMW999				
Aluminum	0.034	0.20U	-	0.166 (≤0.40)	-	-
Barium	0.041	0.042	-	0.001 (≤0.020)	-	-
Cadmium	0.00098	0.0010	-	0.00002 (≤0.0040)	-	-
Calcium	150	150	0	-	-	-
Iron	0.14	0.38	-	0.24 (≤0.40)	-	-
Magnesium	89	93	4	-	-	-
Manganese	0.078	0.078	0	-	-	-

LDC #: 27649A4 **VALIDATION COMPLETENESS WORKSHEET** Date: 5-17-12

SDG #: 500-45518-1 Level III Page: 1 of 1

Laboratory: Test America, Inc. 9m4 Reviewer: MG

2nd Reviewer:

METHOD: Dissolved Metals (EPA SW 846 Method 6010B/~~7000~~) 7470A

The samples listed below were reviewed for each of the following validation areas. Validation findings are noted in attached validation findings worksheets.

	Validation Area		Comments
I.	Technical holding times	A	Sampling dates: 4-16-12
II.	ICP/MS Tune	N	not utilized
III.	Calibration	A	
IV.	Blanks	A	
V.	ICP Interference Check Sample (ICS) Analysis	A	
VI.	Matrix Spike Analysis	SW	MS/MSD
VII.	Duplicate Sample Analysis	A	DUP
VIII.	Laboratory Control Samples (LCS)	A	LCS
IX.	Internal Standard (ICP-MS)	N	not utilized
X.	Furnace Atomic Absorption QC	N	" "
XI.	ICP Serial Dilution	A	
XII.	Sample Result Verification	N	
XIII.	Overall Assessment of Data	A	
XIV.	Field Duplicates	SW	D = 3 + 4
XV	Field Blanks	N	

Note: A = Acceptable; N = Not provided/applicable; SW = See worksheet; ND = No compounds detected; R = Rinsate; FB = Field blank; D = Duplicate; TB = Trip blank; EB = Equipment blank

VALIDATION FINDINGS WORKSHEET
Matrix Spike/Matrix Spike Duplicates

Reviewer: MG
2nd Reviewer: [signature]

METHOD: Trace metals (EPA SW 846 Method 6010/6020/7000)

Please see qualifications below for all questions answered "N". Not applicable questions are identified as "N/A".

(Y) N N/A — Was a matrix spike analyzed for each matrix in this SDG?

Y (N) N/A — Were matrix spike percent recoveries (%R) within the control limits of 75-125? If the sample concentration exceeded the spike concentration by a factor of 4 or more, no action was taken.

(Y) N N/A — Were all duplicate sample relative percent differences (RPD) ≤ 20% for water samples and ≤35% for soil samples?

LEVEL IV ONLY:

Y N N/A — Were recalculated results acceptable? See Level IV Recalculation Worksheet for recalculations.

Introduction

This data review covers 9 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 300.0 for Dissolved Sulfate and Dissolved Nitrate as Nitrogen.

This review follows the Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan (QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. (Rev. 0 July 2009), the U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1 (April 2009), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (October 2004) as there are no current guidelines for the methods stated above.

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met with the following exceptions:

Sample	Analyte	Total Time From Sample Collection Until Analysis	Required Holding Time From Sample Collection Until Analysis	Flag	A or P
JP-M13-GWMW999	Nitrate as N	52.00 hours	48 hours	J (all detects) UJ (all non-detects)	P
JP-M13-GWMW809	Nitrate as N	50.75 hours	48 hours	J (all detects) UJ (all non-detects)	P
JP-M13-GWMW806	Nitrate as N	52.25 hours	48 hours	J (all detects) UJ (all non-detects)	P
JP-M13-GWMW807	Nitrate as N	54.00 hours	48 hours	J (all detects) UJ (all non-detects)	P

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Initial Calibration

All criteria for the initial calibration were met.

III. Calibration Verification

Calibration verification frequency and analysis criteria were met.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No contaminant concentrations were found in the initial, continuing and preparation blanks.

No field blanks were identified in this SDG.

V. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VI. Duplicates

Duplicate (DUP) sample analyses were reviewed for each matrix as applicable.

VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

VIII. Sample Result Verification

Raw data were not reviewed for this SDG.

IX. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

X. Field Duplicates

Samples JP-M13-GWMW362 and JP-M13-GWMW999 were identified as field duplicates. No contaminant concentrations were detected in any of the samples with the following exceptions:

Analyte	Concentration (mg/L)		RPD (Limits)	Difference (Limits)	Flags	A or P
	JP-M13-GWMW362	JP-M13-GWMW999				
Sulfate	270	270	0 (≤25)	-	-	-

Data Validation Report

Project/Site Name: JOAAP-GW

Collection Date: April 16, 2012

LDC Report Date: May 25, 2012

Matrix: Water

Parameters: Explosives

Validation Level: EPA Level III

Laboratory: TestAmerica, Inc.

Sample Delivery Group (SDG): 500-45518-1

Sample Identification

JP-M13-GWMW808
JP-M13-GWMW126R
JP-M13-GWMW362
JP-M13-GWMW999
JP-M13-GWMW809
JP-M13-GWMW806
JP-M13-GWMW807
JP-M13-GWMW126RMS
JP-M13-GWMW126RMSD

Introduction

This data review covers 9 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8330 for Explosives.

This review follows the Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan (QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. (Rev. 0 July 2009), the U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1 (April 2009), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Initial Calibration

Initial calibration of compounds was performed for the primary (quantitation) column and confirmation column as required by the method.

The percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

III. Continuing Calibration

Continuing calibration was performed at the required frequencies.

The percent differences (%D) of amounts in continuing standard mixtures were within the 15.0% QC limits with the following exceptions:

Date	Column	Compound	%D	Associated Samples	Flag	A or P
4/20/12	L3uPH	2,4,6-Trinitrotoluene	16.6	JP-M13-GWMW807	J (all detects) UJ (all non-detects)	A

The percent differences (%D) of the second source calibration standard were less than or equal to 15.0% for all compounds.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No explosive contaminants were found in the method blanks.

No field blanks were identified in this SDG.

V. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VI. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

VIII. Target Compound Identification

Raw data were not reviewed for this SDG.

IX. Compound Quantitation and RLs

The sample results for detected compounds from the two columns were within 40% difference with the following exceptions:

Sample	Compound	%D	Flag	A or P
JP-M13-GWMW362	2-Nitrotoluene	79.0	J (all detects)	A

Raw data were not reviewed for this SDG.

X. System Performance

Raw data were not reviewed for this SDG.

XI. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XII. Field Duplicates

Samples JP-M13-GWMW362 and JP-M13-GWMW999 were identified as field duplicates. No explosives were detected in any of the samples with the following exceptions:

Compound	Concentration (ug/L)		RPD (Limits)	Difference (Limits)	Flags	A or P
	JP-M13-GWMW362	JP-M13-GWMW999				
2,4,6-Trinitrotoluene	0.073	0.097	-	0.024 (≤0.80)	-	-
2,4-Dinitrotoluene	4.9	5.4	10 (≤25)	-	-	-
2-Amino-4,6-dinitrotoluene	1.2	1.2	-	0 (≤1.55)	-	-
4-Amino-2,6-dinitrotoluene	1.1	1.0	-	0.1 (≤1.55)	-	-
2-Nitrotoluene	0.24	2.0	-	1.76 (≤0.80)	J (all detects)	A

Compound	Concentration (ug/L)		RPD (Limits)	Difference (Limits)	Flags	A or P
	JP-M13-GWMW362	JP-M13-GWMW999				
4-Nitrotoluene	0.31U	1.9	-	1.59 (≤0.80)	J (all detects) UJ (all non-detects)	A
3-Nitrotoluene	0.31U	0.19	-	0.12 (≤0.80)	-	-

Laboratory Data Consultants, Inc.
Data Validation Report

Project/Site Name: JOAAP-GW

Collection Date: April 16, 2012

LDC Report Date: May 24, 2012

Matrix: Water

Parameters: Volatiles

Validation Level: EPA Level III

Laboratory: TestAmerica, Inc.

Sample Delivery Group (SDG): 500-45519-1

Sample Identification

JP-M11-GWMW802
JP-M11-GWMW805
JP-M11-GWMW335
JP-M11-GWMW336
JP-Tripblank-0412

Introduction

This data review covers 5 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8260B for Volatiles.

This review follows the Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan (QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. (Rev. 0 July 2009), the U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1 (April 2009), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 15.0% for each individual compound and less than or equal to 30.0% for calibration check compounds (CCCs).

Average relative response factors (RRF) for all compounds were within method and validation criteria.

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0% for all compounds.

The percent difference (%D) of the second source calibration standard were less than or equal to 20.0% for all compounds with the following exceptions:

Date	Compound	%D	Associated Samples	Flag	A or P
4/20/12	Isopropylbenzene	20.4	All samples in SDG 500-45519-1	J (all detects) UJ (all non-detects)	A

All of the continuing calibration relative response factors (RRF) for were within method and validation criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No volatile contaminants were found in the method blanks.

Sample JP-Tripblank-0412 was identified as a trip blank. No volatile contaminants were found.

VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VII. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

IX. Regional Quality Assurance and Quality Control

Not applicable.

X. Internal Standards

All internal standard areas and retention times were within QC limits.

XI. Target Compound Identifications

Raw data were not reviewed for this SDG.

XII. Compound Quantitation and RLs

Raw data were not reviewed for this SDG.

XIII. Tentatively Identified Compounds (TICs)

Raw data were not reviewed for this SDG.

XIV. System Performance

Raw data were not reviewed for this SDG.

XV. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XVI. Field Duplicates

No field duplicates were identified in this SDG.

Laboratory Data Consultants, Inc.
Data Validation Report

Project/Site Name: JOAAP-GW

Collection Date: April 16, 2012

LDC Report Date: May 24, 2012

Matrix: Water

Parameters: Semivolatiles

Validation Level: EPA Level III

Laboratory: TestAmerica, Inc.

Sample Delivery Group (SDG): 500-45519-1

Sample Identification

JP-M11-GWMW802
JP-M11-GWMW805
JP-M11-GWMW335
JP-M11-GWMW336

Introduction

This data review covers 4 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8270C for Semivolatiles.

This review follows the Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan (QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. (Rev. 0 July 2009), the U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1 (April 2009), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 15.0% for each individual compound and less than or equal to 30.0% for calibration check compounds (CCCs) with the following exceptions:

Date	Compound	%RSD	Associated Samples	Flag	A or P
5/1/12	N-Nitrosodimethylamine 3&4-Methylphenol Dibenzofuran Di-n-butylphthalate Benzo(k)fluoranthene	33.0 19.0 17.0 17.0 22.0	JP-M11-GWMW802 JP-M11-GWMW805 JP-M11-GWMW335 MB 500-146890	J (all detects) J (all detects) J (all detects) J (all detects) J (all detects)	A
4/25/12	Benzoic acid 2,4-Dinitrophenol	55.0 19.0	JP-M11-GWMW336	J (all detects) J (all detects)	A

In the case where the laboratory used a calibration curve to evaluate the compounds, all coefficients of determination (r^2) were greater than or equal to 0.990 .

Average relative response factors (RRF) for all compounds were within method and validation criteria.

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0% for all compounds with the following exceptions:

Date	Compound	%D	Associated Samples	Flag	A or P
5/4/12	N-Nitrosodimethylamine Benzoic acid 2,4-Dinitrophenol 4-Nitrophenol	41.8 44.4 32.5 25.6	JP-M11-GWMW336	J (all detects) UJ (all non-detects)	A

The percent differences (%D) of the second source calibration standard were less than or equal to 20.0% for all compounds with the following exceptions:

Date	Compound	%D	Associated Samples	Flag	A or P
5/1/12	2-Methylnaphthalene Dibenzofuran Di-n-butylphthalate	20.3 21.3 20.5	JP-M11-GWMW802 JP-M11-GWMW805 JP-M11-GWMW335 MB 500-146890	J (all detects) UJ (all non-detects)	A
4/25/12	Benzoic acid	125.4	JP-M11-GWMW336	J (all detects) UJ (all non-detects)	A

All of the continuing calibration relative response factors (RRF) were within method and validation criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No semivolatile contaminants were found in the method blanks.

No field blanks were identified in this SDG.

VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VII. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were not within QC limits. Since there were no associated samples, no data were qualified.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

IX. Regional Quality Assurance and Quality Control

Not applicable.

X. Internal Standards

All internal standard areas and retention times were within QC limits.

XI. Target Compound Identifications

Raw data were not reviewed for this SDG.

XII. Compound Quantitation and RLs

Raw data were not reviewed for this SDG.

XIII. Tentatively Identified Compounds (TICs)

Raw data were not reviewed for this SDG.

XIV. System Performance

Raw data were not reviewed for this SDG.

XV. Overall Assessment

Data flags are summarized at the end of this report if data has been qualified.

XVI. Field Duplicates

No field duplicates were identified in this SDG.

Data Validation Report

Project/Site Name: JOAAP-GW

Collection Date: April 16, 2012

LDC Report Date: May 18, 2012

Matrix: Water

Parameters: Dissolved Metals

Validation Level: EPA Level III

Laboratory: TestAmerica, Inc.

Sample Delivery Group (SDG): 500-45519-1

Sample Identification

JP-M11-GWMW802
JP-M11-GWMW805
JP-M11-GWMW335
JP-M11-GWMW336

Introduction

This data review covers 4 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Methods 6010B and 7470A for Dissolved Metals. The metals analyzed were Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Vanadium, and Zinc.

This review follows the Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan (QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. (Rev. 0 July 2009), the U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1 (April 2009), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (October 2004) as there are no current guidelines for the methods stated above.

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. ICPMS Tune

ICP-MS was not utilized in this SDG.

III. Calibration

An initial calibration was performed.

The frequency and analysis criteria of the initial calibration verification (ICV) and continuing calibration verification (CCV) were met.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No dissolved metal contaminants were found in the initial, continuing and preparation blanks.

No field blanks were identified in this SDG.

V. ICP Interference Check Sample (ICS) Analysis

The frequency of analysis was met.

The criteria for analysis were met.

VI. Matrix Spike/(Matrix Spike) Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VII. Duplicate Sample Analysis

The laboratory has indicated that there were no duplicate (DUP) analyses specified for the samples in this SDG, and therefore duplicate analyses were not performed for this SDG.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

IX. Internal Standards (ICP-MS)

ICP-MS was not utilized in this SDG.

X. Furnace Atomic Absorption QC

Graphite furnace atomic absorption was not utilized in this SDG.

XI. ICP Serial Dilution

ICP serial dilution analysis was not performed by the laboratory.

XII. Sample Result Verification

Raw data were not reviewed for this SDG.

XIII. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XIV. Field Duplicates

No field duplicates were identified in this SDG.

Laboratory Data Consultants, Inc.
Data Validation Report

Project/Site Name: JOAAP-GW

Collection Date: April 16 through April 17, 2012

LDC Report Date: May 18, 2012

Matrix: Water

Parameters: Wet Chemistry

Validation Level: EPA Level III

Laboratory: TestAmerica, Inc.

Sample Delivery Group (SDG): 500-45519-1

Sample Identification

JP-M11-GWMW802
JP-M11-GWMW805
JP-M11-GWMW335
JP-M11-GWMW336
JP-M9-GWMW330
JP-M9-GWMW330MS
JP-M9-GWMW330MSD

Introduction

This data review covers 7 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 300.0 for Dissolved Sulfate and Dissolved Nitrate as Nitrogen.

This review follows the Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan (QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. (Rev. 0 July 2009), the U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1 (April 2009), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008) as there are no current guidelines for the method stated above.

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Initial Calibration

All criteria for the initial calibration were met.

III. Calibration Verification

Calibration verification frequency and analysis criteria were met.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No contaminant concentrations were found in the initial, continuing and preparation blanks.

No field blanks were identified in this SDG.

V. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VI. Duplicates

Duplicate (DUP) sample analyses were reviewed for each matrix as applicable.

VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

VIII. Sample Result Verification

Raw data were not reviewed for this SDG.

IX. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

X. Field Duplicates

No field duplicates were identified in this SDG.

Laboratory Data Consultants, Inc.
Data Validation Report

Project/Site Name: JOAAP-GW

Collection Date: April 15 through April 16, 2012

LDC Report Date: May 24, 2012

Matrix: Water

Parameters: Explosives

Validation Level: EPA Level III

Laboratory: TestAmerica, Inc.

Sample Delivery Group (SDG): 500-45519-1

Sample Identification

JP-M06-GWMW654
JP-M11-GWMW802
JP-M11-GWMW805
JP-M11-GWMW335
JP-M11-GWMW336
JP-M11-GWMW336MS
JP-M11-GWMW336MSD

Introduction

This data review covers 7 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8330 for Explosives.

This review follows the Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan (QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. (Rev. 0 July 2009), the U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1 (April 2009), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Initial Calibration

Initial calibration of compounds was performed for the primary (quantitation) column and confirmation column as required by the method.

The percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

III. Continuing Calibration

Continuing calibration was performed at the required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 15.0% QC limits with the following exceptions:

Date	Column	Compound	%D	Associated Samples	Flag	A or P
4/20/12	L3uPH	2,4,6-Trinitrotoluene	16.6	All samples in SDG 500-45519-1	J (all detects) UJ (all non-detects)	A

The percent differences (%D) of the second source calibration standard were less than or equal to 15.0% for all compounds.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No explosive contaminants were found in the method blanks.

No field blanks were identified in this SDG.

V. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VI. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

VIII. Target Compound Identification

Raw data were not reviewed for this SDG.

IX. Compound Quantitation and RLs

The sample results for detected compounds from the two columns were within 40% difference with the following exceptions:

Sample	Compound	%D	Flag	A or P
JP-M06-GWMW654	RDX 3-Nitrotoluene	182.3 149.1	J (all detects) J (all detects)	A

Raw data were not reviewed for this SDG.

X. System Performance

Raw data were not reviewed for this SDG.

XI. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XII. Field Duplicates

No field duplicates were identified in this SDG.

VALIDATION FINDINGS WORKSHEET
Compound Quantitation and Reported CRQLs

Reviewer: [illegible]
2nd Reviewer: [illegible]

METHOD: ___ GC __✓__ HPLC

Please see qualifications below for all questions answered "N". Not applicable questions are identified as "N/A".

Level IV/D Only

Y N N/A Were CRQLs adjusted for sample dilutions, dry weight factors, etc.?
Y N N/A Did the reported results for detected target compounds agree within 10.0% of the recalculated results?
Y N N/A Did the percent difference of detected compounds between two columns./detectors ≤40%?
If no, please see findings bellow.

#	Compound Name	Sample ID	%D Between Two Columns/Detectors Limit (≤ 40%)	Qualifications
	B	1	182.3	J/A duts
	M	↓	149.1	↓

Laboratory Data Consultants, Inc.
Data Validation Report

Project/Site Name: JOAAP-GW

Collection Date: April 14 through April 15, 2012

LDC Report Date: May 25, 2012

Matrix: Water

Parameters: Explosives

Validation Level: EPA Level III

Laboratory: TestAmerica, Inc.

Sample Delivery Group (SDG): 500-45521-1

Sample Identification

JP-M06-GWMW123R
JP-M07-GWMW124R
JP-M06-GWMW162R
JP-M06-GWMW212R
JP-M06-GWMW995
JP-M06-GWMW313
JP-M06-GWMW318
JP-M06-GWMW319
JP-M06-GWMW652
JP-M06-GWMW994

Introduction

This data review covers 10 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8330 for Explosives.

This review follows the Joliet Army Ammunition Plant (JOAAP) Quality Assurance Project Plan (QAPP) for Long Term Monitoring, prepared by MWH Americas, Inc. (Rev. 0 July 2009), the U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1 (April 2009), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Initial Calibration

Initial calibration of compounds was performed for the primary (quantitation) column and confirmation column as required by the method.

The percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

III. Continuing Calibration

Continuing calibration was performed at the required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 20.0% QC limits.

The percent differences (%D) of the second source calibration standard were less than or equal to 20.0% for all compounds.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No explosive contaminants were found in the method blanks.

No field blanks were identified in this SDG.

V. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits with the following exceptions:

Sample	Surrogate	%R (Limits)	Compound	Flag	A or P
JP-M06-GWMW318	1,2-Dinitrobenzene	201 (54-148)	All TCL compounds	J (all detects)	P

VI. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VIII. Target Compound Identification

Raw data were not reviewed for this SDG.

IX. Compound Quantitation and RLs

The sample results for detected compounds from the two columns were within 40% difference with the following exceptions:

Sample	Compound	%D	Flag	A or P
JP-M06-GWMW162R	2,4-Dinitrotoluene	113.0	J (all detects)	A
JP-M06-GWMW212R	4-Amino-2,6-dinitrotoluene 2-Amino-4,6-dinitrotoluene	61.5 60.2	J (all detects) J (all detects)	A
JP-M06-GWMW318	2,6-Dinitrotoluene 2,4-Dinitrotoluene	146.1 176.1	J (all detects) J (all detects)	A
JP-M06-GWMW319	2,4,6-Trinitrotoluene	129.6	J (all detects)	A
JP-M06-GWMW652	4-Amino-2,6-dinitrotoluene	67.5	J (all detects)	A
JP-M06-GWMW994	4-Amino-2,6-dinitrotoluene 4-Nitrotoluene	71.9 57.2	J (all detects) J (all detects)	A

Raw data were not reviewed for this SDG.

X. System Performance

Raw data were not reviewed for this SDG.

XI. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XII. Field Duplicates

Samples JP-M06-GWMW123R and JP-M06-GWMW995 and samples JP-M06-GWMW652 and JP-M06-GWMW994 were identified as field duplicates. No explosives were detected in any of the samples with the following exceptions:

Compound	Concentration (ug/L)		RPD (Limits)	Difference (Limits)	Flags	A or P
	JP-M06-GWMW652	JP-M06-GWMW994				
1,3-Dinitrobenzene	9.5	7.9	-	1.6 (≤80)	-	-
2,4,6-Trinitrotoluene	1600	1300	21 (≤25)	-	-	-
2,4-Dinitrotoluene	8400	6800	21 (≤25)	-	-	-
2,6-Dinitrotoluene	3300	2700	20 (≤25)	-	-	-
2-Amino-4,6-dinitrotoluene	360	320	12 (≤25)	-	-	-
4-Amino-4,6-dinitrotoluene	380	320	17 (≤25)	-	-	-
2-Nitrotoluene	44000	35000	23 (≤25)	-	-	-
4-Nitrotoluene	28000	22000	24 (≤25)	-	-	-
